PREFACE TO NEW EDITION.

IN prefacing this new and revised edition of 'Hindu-Koh,' its author has little more to say than to thank his readers and reviewers for the kind and indulgent way in which the book has been received. An opinion was frequently expressed that an index would have been an advantage, and this has now been added.

PREFACE TO FIRST EDITION.

THE subject of Himalayan travel and sport is now so old a story, that an attempt to create further interest in it is an almost hopeless undertaking, especially for one who has been more accustomed to handling the mountain-staff than the pen. But, old though it be, the field it embraces is so vast, that it may still afford scope for variety even should it lack originality; and such the author would fain trust may be the case in this instance. The following pages, however, are in no wise embellished with a vein of romance, which, whilst perhaps rendering a narrative of this kind more attractive to the general reader, is apt to give a fanciful

and overdrawn picture of the reality. Nor has their writer any pretension to being either an erudite traveller, or a mighty hunter to whom hair-breadth escapes and thrilling adventures have been common occurrences. Consequently he is well aware that he is somewhat rashly launching his frail craft, so to speak, on the ruthless waves of criticism, with a very great risk of its foundering. But he trusts that the friends at whose suggestion he has ventured to put these simple reminiscences into print, and his brother sportsmen—more particularly the younger ones, for whom they are in a great measure intended—may find something to divert them in this humble endeavour of an old member of the fraternity to portray a few scenes and incidents gathered from his *bona fide* notes of wanderings and wild sport among the fells and forests of the Himalaya Mountains, and on the bare rolling uplands beyond them.

CONTENTS.

CHAPTER I.

	PAGE
An old muzzle-loader — Hindu-Koh — Himalayan scenery and sport—Juvenile wild sports—Wild sheep and gazelles—Start for the mountains—Simla—Deodar cedar forests—Rhododendron-trees—The snowy range in prospect—Crossing a “jula” —Mussoorie—Dehra Doon—An interview with some of its wild denizens—Hurdwar—The holy fair there, and one of its consequences—The Terai—Nynee Tāl—Arrive at Shore,	1

CHAPTER II.

Outpost of Shore—The Thakil—A haunted house—What happened in it—Himalayan black bear—A bear-hunt—Bear-shooting in the oak-trees—The sloth-bear—A she-bear to the rescue—Result of a practical joke—Village beehives—Tiger-charms—A tiger tale—Fables about Bruin—Where to hit him,	9
--	---

CHAPTER III.

The mahseer—Monster fish taken with the rod—The mahseer compared with the salmon—Salmonidæ never found in India—A fishing-river in the Himalayas—The Surjoo valley—Its wild denizens — The jurrow — Barking-deer — The Goorkha “kookerie” — Tempting Providence—A damp couch—Jurrow-hunting under difficulties—A heavy fish lost—The way we inveigled the wily mahseer—Jungle fare—Dense morning mists	
--	--

—A forenoon's sport in the Surjoo—Best months and best flies for mahseer-fishing in the Himalayan rivers—Fishing theories,	21
--	----

CHAPTER IV.

Delightful climate—Start for Dhuj—"Baloo Mar," the village Nimrod—The gooral, or "Himalayan chamois"—Albino gooral—A strange coincidence—Up Dhuj—Sunrise over the snowy range—Game in sight—"Buck fever" and its usual result—Kill a buck—Kallee pheasants—Wild pigs—The cheer pheasant—Singular effect of morning mist—Securing a troublesome specimen—A bold intruder—The koklass pheasant and the pewra partridge—A chance shot in the dim moonlight—Baloo!—Almost too close to be pleasant—The surrow—A drive for jurrow—Village curs—Wild dogs—A cruel lesson,	33
---	----

CHAPTER V.

A "dirty" way of killing jurrow—An artificial salt-lick—Old Jeetoo—Watch for a leopard—We try a ruse—An airy night's lodging—An exciting moment—Bad luck—Jeetoo tries to propitiate the mountain spirit—A splendid stag—Tracking—Shooting at night—A sight for night-work—A carrion-eating tiger—We watch for him—A man-eating leopard—A hunt after a feline demon,	48
---	----

CHAPTER VI.

Start for the higher ranges—The Chipla mountain—The tahr—Its flesh and bones used as medicine—An enormous wild cat—"Peepsa" flies—Agriculture and agriculturists on the higher ranges—My first day's sport on the Chipla—A picturesque bivouac—Exorcising an evil spirit—A long and weary climb—Beautiful rhododendrons—Horned argus-pheasant—We try a stalk for pork—An uncomfortable bed, and the way we improved it—Moonal pheasants—Bad ground—An awkward climb—Two dangerous experiments—Primitive tobacco-pipes—Light and shade effects on the mountains—The great bearded vulture—The musk-deer and its scent-bag—A snow-storm—The valley of the Kallee or Sarda,	62
--	----

CHAPTER VII.

On the Chipla—Its general features—Right and left at tahr and gooral—Dangerous footing—Kurbeer has a narrow escape—A welcome haven—Annual burning of the dry grass on the mountains—A herd of old buck tahr—Difficulties of a downhill stalk—A tremendous drop—Wounded tahr lost in the mist—Bad weather—An awkward bit—Sensations on bad ground—A chance lost—Salt-licks—Tartar nomads—Mountain belles—Best season for tahr-shooting, 79

CHAPTER VIII.

Start for Cashmere—Best season for ibex-hunting—The beautiful Jhelum—A reason for her caprices—Ancient ruins—First glimpse of the Vale—Srinuggur—Cashmere shikarees—Origin of the shawl pattern—Islamabad—Ramzan Meer—The true shikaree and the impostor—A narrow escape—Nouboog Nye—The Mergun pass—"Puttees" and "poolas"—Marmots—Wurdwan—Two bears, right and left—The Himalayan brown bear—Making "poolas"—Stormy weather—A wild night—An ugly customer in an awkward position—Heavy snowfall—Avalanches—Mārroo—An earthquake—A patriarchal old buck—Anguish—The Himalayan ibex—Ramzan's idea of ibex alighting on their horns—A frugal repast, 92

CHAPTER IX.

The Furriabadee glen—Hot spring—Watching ibex—Disturbing a family party—Bear cubs; too young to shoot, but too old to be caught—Benighted on the hill—Forest, fell, and flood—Snow-slopes—A long and difficult stalk—Counting one's chickens before they are hatched—The impostor ruins our chance—"Vanity and vexation of spirit"—"Dook"—A herd of splendid ibex—Old Ramzan's way of steadying my nerves—His grievous disappointment—Luck at last—More big bucks—Satisfaction all round—Black-bear shooting in the mulberry-groves—Old Mirza; surgeon and barber—A hummām in Srinuggur—A strange presentiment sadly fulfilled—Fishing in the Jhelum—Prohibited in certain places—The reason why—*Dolce far niente*—Shawl-weavers, 113

CHAPTER X.

Dehra Doon—Fossil remains in the Sewalik hills—Variety of game—Spear-grass—A day after small game—Otters—Camp in the Eastern Doon—Self-denial—Elephant sagacity—A plucky mahout—A queer adventure with a crocodile—Pythons—The way we hunted them—Hog-deer—The “cheetal” or spotted deer—Irregularity in shedding their horns—Four-horned antelopes—The swamp-deer, 128

CHAPTER XI.

“Null” jungle—Natives treed by a tigress—Cane-brakes—Danger of a timid elephant—A vicious “muckna”—Bogged in a “fussand”—Moula Buksh displays his evil disposition—A terrible game at football—The Kumaon elephant-khedda—A ride after wild elephants—Taming the recent captures—An elephant gladiator—Bringing in a prisoner—Wild bees—The result of disturbing them—We beat a retreat—A contumacious tiger—A general scrimmage, 147

CHAPTER XII.

The surrow—Gopee Chund hill—Native folk-lore concerning it—A lucky shot—Extraordinary spectacle—Another lucky shot—An old and valued friend—The spirits of the mountain—A shockingly bad shot—Driving out a surrow—A beautiful scene—Wild animals recovering from bad wounds—A mended bone—Driving a “khud”—The surrow are circumvented, 161

CHAPTER XIII.

Summer in the plains of India—The Pir Punchal range—A native gentleman—Kazima—Two real shikarees—The markhor—Glorious panorama of mountain scenery—A serious accident and an awkward predicament—Hatha’s surgery—Native hospitality—A “drive” under difficulties—Dangerous slopes, 172

CHAPTER XIV.

Difficulty of finding great old markhor—A morning call at Bruin's quarter—"Not at home"—Up among the pines—Birch-bark and some of its uses—Cold tea—A herd of markhor—A wild tableau—An awkward position for a shot—Gamoo implores the assistance of Allah and the Prophet—A shadow of doubt—All's well—Jerking the meat—Blackbirds—Snow-bridges—Just in time for a shot—A bitter drop in the cup of happiness—Gamoo and Hatha search for a talisman—The bezoar—Our luck deserts us—Grief—A random shot and its consequences—An unexpected apparition—A close shave—We try a glissade—A startling sight—Kazima's first testimonial, 181

CHAPTER XV.

Stag-shooting in Cashmere compared with deer-stalking in Scotland—The "rutting" season—The Cashmere stag—Watching for a stag—A love-song—A royal hart—Human vultures—A miss in the dark—Splendid view of "the Vale"—Our reveries are disturbed—Wild music—Ramzan's strategy—A rather mean advantage—Remorse—A challenge and a reply—Recklessness of stags during the rutting season—An artifice for attracting them—With what success we tried it—A native practitioner—Forced to submit to his tender mercies, 199

CHAPTER XVI.

An unexpected meeting with a stranger in the land—Cold quarters—Tracking in the snow—The short twilight fails us—We lose our wounded stag—The forest monarch—A charmed life—Doubtful satisfaction—Lost trophies are always the finest—An exciting but rather "shady" way of doing business—A night vigil—The Goojur's black stag—An invasion of rats and mice—How we circumvented the black stag—A grand set of horns—Cashmere method of driving a gorge—Making a virtue of necessity—Why "hangul" have decreased in numbers, 215

CHAPTER XVII.

Start for Ladak—The beautiful Sind valley—The capital of Ladak—Burning sun and variations of temperature—Captain Basevi, R.E.—Join a brother sportsman—Buddhist mānes—Cross the Chang la—The Himalayan and Tibetan perpetual-snow lines—Tanksee—Our guide Changter—Cheap mutton—View of the Pangong tso (lake)—Clearness of Tibetan atmosphere—Across the Marsemik la—“Chung” and “grim”—Changchenmo—A treacherous ford—The Kugrang glen—The kiang—Antelopes—A bewildered buck—Completely “pumped”—The “tsos,” or Tibetan antelope—Unpleasant effects of rarefied air—The native’s idea concerning them—Striking scenery—The dong, or wild yak—Tibetan fox—Stalking a dong—Yak beef—A snowy night and a cheerless morning—Boortzé the chief fuel of Tibet—A Tartar breakfast—Hair-cutting with a knife—Tibetan hares—Trout-like fish—We celebrate our meeting with Captain Basevi—A rare *menu*—Basevi’s sad fate, 228

CHAPTER XVIII.

The *Ovis Ammon*—The Pangong lake—A joyless solitude—Loneliness—Lukkur’s escapade—The cause of it—A long and lucky shot—The lord of the flock is left behind—Black wolf—Tibetan marmot—Camped above 17,000 feet, 255

CHAPTER XIX.

Hanlé—The Goa or Tibetan gazelle—Two bucks descried—Result of forgetting to load—The Chinese border—An interview with the borderers—Their behaviour—A curious incident—A lucky right-and-left—Great variety of wild-flowers—Packs of sand-grouse—The Tso Morari—Its characteristics—Wild geese—A high and cold camp—Twelve degrees of frost in August—The Tso Kar or Salt Lake—Its fresh-water neighbour—Wild-fowl—A blanket city—Brood of snow-pheasants—A snowy waste—Valley of the Parang—The Parang la—Across it in a snowstorm—Endurance of the yak—A ludicrous picture—The summit at last—Nature’s awful works—A surgical operation—The nāpoo or burrell—Two killed—Im-

mense glaciers—Kulu scenery—Return to civilisation—An old but interesting newspaper—Kangra valley—The end of a long journey, 264

CHAPTER XX.

Prepare to revisit trans-Himalayan regions—The Bhōtias—After tahr—Up the valley of the Doulee—Cascade of Bingareebeyl—An “enchanted” glen—Bad ground—Our coolies object to proceed—Puddoo’s persuasive powers—A precarious position—An unpleasant night in an eerie situation—A mysterious old tahr—A sanctuary for game—Musk-deer—A grand surprise—Superb snow-scene—Doonagiri purbat—Old tahr bucks—Their eccentric gambols—The evil genius of the glen dogs our footsteps—Up among the clouds—A short cut not always the quickest—Surprise a musk-deer in the mist—Overtaken by darkness—A rather perilous descent—Welcome assistance, 288

CHAPTER XXI.

Doonagiri village—A Himalayan glacier—Ascents of Himalayan snow-peaks—Obstacles thereto—Burrell-ground—Kill two rams—Female porters—Fine old deodar-trees—Bhōtia villages of Kosa and Malāri—Burglarious bears—Solitude and desolation—Bhōtias, male and female—Niti village—Strange collection of old shoes—Tibetan envoy—The “Jooboo”—From Niti to Goting—Summer avalanches—Old birch-trees—Snow-pheasants—Bad walking—A day’s sport at Goting—An awkward bridge—Alpine rose—A grand old ram—A mistake—A snow-leopard shares our spoils—Wild defile—The Niti pass—View of Hundés from its summit—A noteworthy watershed—Sketching under difficulties—A terribly cold camp—A deputation from the Jongpen—Our Hoonya escort, 303

CHAPTER XXII.

Impressions of Hundés—Wary old rams—Kiangs in the way—The Jongpen’s messengers return—Signing a contract—Strange acoustic effect—Hoonya sheep-shearing, milking, &c.—An *Ovis Ammon* with bronchitis—Grey wolves—Dongpu—A Tartar hamlet—Large troops of kiang—Their

manœuvres — The Sutlej — The Lāl Dākā — Venison for camp—How we caught a dish of fish—A study in entomology — *Embarras des richesses*—The Dukka hills — Misfortunes will happen—They never come single — A cruelly cold morning in June—Large flock of big rams—In the nick of time—A most enjoyable smoke—After a wounded ram—Intruders on the scene—Just too late—A bewildered flock—A tantalising opportunity—A tiresome trudge—Welcome rest, 320

CHAPTER XXIII.

Sudden change of temperature—An unexpected event—A brother sportsman turns up—"It never rains but it pours"—We try a little fish-poaching — A welcome post-bag—Burrell again—Waiting for a ram to rise—"Habet"—A nursery of wild sheep—A long chase—A lucky fluke—Our Hoonya escort departs—Bed of fossils—Tibetan *douane* — Afternoon tea—The way it was made—Dice-throwing—A token of goodwill from the Jongpen — Tibetan method of curing butter—A trying job—Recross Niti pass—Bhōtia whisky — Puddoo imbibes rather freely—A bit of advice—A change for the better—Puddoo & Co. celebrate their return home—A transformation-scene in the theatre of nature — Ramnee — Farewell to the grand old Himalayas, 337

CHAPTER XXIV.

Containing a few hints concerning kit, camp-equipage, &c., for a Himalayan hunting-trip, which, to the young hand, may be useful, 351

INDEX, 357

H I N D U - K O H .

CHAPTER I.

THE bygone performances of an old "muzzle-loader" may perhaps be considered rather obsolete by the young sportsman of the present with his double "express." But as human nature always has been, and, I opine, ever will be much the same, the pleasure of studying the habits of wild animals in their native haunts, the excitement of the stalk, and the charming influence of grand and beautiful scenery, must be little altered now from what they were years ago, when first I tried my "'prentice hand" with the rifle among the highest mountains in the world.

Before proceeding to narrate these old-fashioned performances, let me account for the heading I have given this book, as to some it may appear far-fetched. So many works had already been produced on the same subject, with a "Himalayan" cognomen, that I was at a loss to find a new name for such an oft-told tale. To quote Solomon, "There is no new thing under the sun," so I selected as a title an old and but little-known designation for the Himalayas—"Hindu-Koh"; and an ancient name would, I thought, suit well with a somewhat threadbare topic. Moreover, as every high

peak of this mountain-chain is to Hindoos an object of more or less veneration, this term,¹ which signifies "Hindoo mountain," is, I think, quite as apposite, though perhaps not so pretty as *Himalaya*—derived, it is said, from two Sanskrit words, *hima* and *ayala*, "abode of snow."

It is now generally accepted as a well-established fact, that these great northern bulwarks of Hindustan, and their vicinity, contain hunting-grounds which may be classed among the best that are known. For grandeur of scenery, the Himalayas stand unrivalled. Dame Nature has, indeed, been more lavish of her charms here than in any other part of the universe. That these are not exaggerated assertions, the many interesting records that have already been written on the well-worn though inexhaustible subjects of Himalayan travel and sport bear ample testimony, and render the following humble attempt to describe some of my own unscientific wanderings and experiences quite unnecessary for this purpose.

Long ere I was old enough to handle a gun, an innate love of the pursuit of the *feræ naturæ* found vent in trapping birds by the numerous means devised in the youthful mind, and in rambling in quest of their eggs; rat-hunting at the dismantling of a corn-stack, the wild excitement of which, I then thought, nothing could surpass; and suchlike ways of indulging juvenile sporting instincts. I doubt whether the keen delight felt on killing my first game-bird—a woodcock—has in all my shooting experiences been equalled. To my good fortune in having been a Goorkha, so to speak, during the whole of my service in India, is due the fact of my having had such opportunities of fostering this taste for wandering and wild sport as seldom fall to the lot of the sojourner in the far East. For the Goorkha battalions are generally quartered either in or near the Hima-

¹ *Koh* being the Persian for "mountain," this name probably originated with the more western Asiatics. The range was known to ancient European geographers as *Emodos* and *Imaus*.

layas; and the Nepalese mountaineers, of whom they are composed, are second to no other shikarees, not to say soldiers, in the world.

The first three years of my service were passed at Peshawur, which, though an excellent school for a soldier lad, from the practical lessons taught in the frequent expeditions that took the field from it against the turbulent hill-tribes on the frontier, afforded little scope for sporting proclivities beyond good snipe-shooting and quail when in season, or an occasional chance of hawking the Oubara (small bustard), &c., in which sport the richer natives of the Peshawur valley often indulge.

Towards the end of 1853 we marched for Rawul Pindi, in the Punjab, a much better field for sport, owing to its proximity to the foot of the Himalayas—its neighbourhood being then well stocked with game—and the excellent mahseer-fishing which was to be had within reachable distance.

I was out after Oorial,¹ the wild sheep of the Punjab (*Ovis cycloceros*), and gazelles, here termed “ravine deer” (*Gazella Bennettii*), among the comparatively low but somewhat rugged hills, and the deep ravines in the western part of the Rawul Pindi district, when I was recalled from my leave and ordered to proceed with a recruiting-party to an outpost on the Nepal frontier, in the mountain province of Kumaon. It was then the end of March, and I had two months of hot travel before me, as there were in those days no railways in Upper India. But the long journey was of little account, with a cool climate and such a fine country for game in prospect at its termination.

Marching through the plains of India during the hot season is by no means pleasant. I therefore resolved to avoid the heat, the dust, and their concomitant evils as

¹ The Oorial is the almost exact counterpart of the Moufflon of Southern Europe. It is found plentifully distributed over the Salt-range in the Punjab, and among the lower ranges of Afghanistan.

much as possible, by diverging from the regular route and travelling for a part of the way through the outer Himalayan ranges. With this intent I made direct for Simla—that Indian Capua which, with its salubrious climate and social attractions, is, like its ancient prototype, much favoured by the magnates of the empire, who are wont to luxuriate there during a great part of the year. Thence, about ten days' stiff marching brought us to that other popular, but less ostentatious, mountain resort—Mussoorie. The scenery and climate on this portion of the journey were a truly delightful change after the dreary monotony and thick sultry atmosphere of "the plains." The clear bracing air of the mountains and the refreshing fragrance of pine-woods instilled new life into one. Now our path would wind for miles through forests of noble deodar cedars, or of grand old oaks and rhododendrons, their gnarled and crooked branches all bedecked with lichen and orchids, or ragged with trailing beards of grey moss; and the rhododendrons (which here are not merely shrubs, but large forest-trees), although past the season of their flowering prime, were still gorgeous with a wealth of crimson blossoms. Now it lay along some bright green valley, beside a clear brawling brook dancing in the sunshine over its pebbly bed, and flanked on either side by wooded heights or steep grassy slopes. Sometimes, where it traversed a rocky eminence or an open hillside, a superb panorama of the distant range of perpetual snow would be disclosed to view,—the long irregular chain of grand frozen peaks and ridges rising sharply on the clear sky-line, and stretching away right and left, their pale summits gradually becoming more indistinct as they sank towards the far horizon.

The greater part of a day was spent in crossing a deep, rapid river by a rope bridge, or "jula" as it is called. A stout rope is stretched from side to side, generally between two convenient rocks. Each man or bundle of baggage is placed on a short plank of wood, like the seat of a swing, which is attached to the main rope by a crooked bit of

stick, forming a kind of running-block. The load, animate or inanimate, is sent sliding along down the rope as far as its weight will take it, and then hauled up to the opposite side by a guy-rope attached to the running-block. Although there was little or no danger, I was glad to find myself on *terra firma* again after being swung over, the more so as I had just seen the load of baggage that preceded me left dangling in mid-air above the roaring torrent, until the guy-rope, which had parted company with the block, was replaced by an acrobatic individual who clambered out on the main rope to repair damages. There is another kind of jula, made of ropes formed of twigs, twisted and bound tightly together, which, though more elaborate in its construction, requires more nerve to cross. For the crosser has to perform a sort of dance on the slack-rope, with nothing to prevent his falling from it into the water but two smaller ropes for his hands to clutch on either side.

Before descending from Mussoorie to the Dehra Doon, through which a portion of our route lay, the view of this beautiful valley, as we looked down on it from the heights abruptly rising 5000 or 6000 feet above it, was singularly imposing. Some fifty miles long by about twelve miles broad, and over 2000 feet high, this forest-clad valley or "Doon" lies along the base of the mountains, its wide-spreading jungles interspersed here and there with open tracts of long grass, irregular patches of reclaimed land, and intersected by broad beds of shingle and sand, where the tortuous streams flowing along them shone afar in the sunlight like bright threads of silver. On the east and west it is bounded by the rivers Ganges and Jumna respectively, where they first issue from the vast mountain-gorges through which they roll down from their sources among the eternal snow; on the south, by the low but very rugged and wooded belt of the Sewalik hills separating it from the plains beyond, which fade gradually away in the distant heat-haze that blurs the horizon.

Our way next led through these dense woods, in which,

one morning, I chanced to have a rather exciting interview with some of their wild denizens. Having heard pea-fowl calling hard by, I had left the road in quest of them, followed by a little Goorkha carrying my rifle. As we were skirting along a large patch of very tall reeds (called *null* or *nurkul*), a rustling noise, evidently made by the movement of some large animal, was heard therein. Our doubts as to what it could be were soon dispelled by finding the fresh droppings and tracks, or "mullen," as the latter are there called, of wild elephants, as well as by sundry snorts and rumbling sounds which were now and again heard. Loading my gun with bullets, and exchanging it with the Goorkha for the rifle, we stole cautiously through the reeds towards the spot whence the sound proceeded, and had not to go far ere I discovered the head and big flapping ears of an elephant a short distance from me. Suddenly detecting our presence, the animal cocked forward its ears, whisked round in an instant, and went crashing away through the reeds, followed by two well-grown calves, of which I just caught a glimpse as they disappeared. In my excitement I let drive at the old one's stern, which foolish example was followed by my companion. She merely gave a shrieking trumpet and continued her flight. Had I then been more experienced in such matters, I should have known the danger and folly, not to mention the cruelty, of so reckless a proceeding; and had it chanced to have been a male, he might have made our position rather hot.

Thinking we had seen the last of the elephants, we had cleared out of the reeds, and had been skirting along them for some distance, when again we heard a tremendous crashing amongst them. Each moment it grew louder as it rapidly drew nearer. Either the injured elephant, or one of her mates that we had not seen, was evidently making straight for us, with the intention, we imagined, of resenting our rash and random shots. The business now seemed about to assume a more serious aspect, for we were in the open,

and not a tree of any size was near round which we might have dodged the animal; but the plucky little Goorkha stood firm as a rock as he quietly whispered, "Look out, Sahib! we'll give it her in the head when it comes in sight." However, perhaps fortunately, no head appeared, for just as we expected the elephant to be down upon us, with a loud snort it suddenly stopped short, and nothing more did we see or hear of it but the rustling of the reeds as it made off.

After three days' travel through the Doon, we quitted the hill-tracts for the open plains, where we crossed the Ganges at Hurdwar. The great holy fair at this place of Hindoo sanctity, where countless thousands of pilgrims annually congregate to purify themselves in the sacred river, was recently over, and the vast crowds had dispersed, carrying with them, far and wide, that terrible pest, cholera, which, as usual, had broken out amongst this sweltering mass of humanity in a fearfully virulent form. I firmly believe that those dreadful epidemics which sometimes almost devastate whole districts of Hindustan and its neighbouring countries, emanate principally from this source.

After ten days' weary travel through a fiery atmosphere, resembling the colour of pea-soup, myriads of flies, and with disease rampant around, we hailed with intense relief and joy our first sight of the outer hills of Kumaon, as they loomed through the murky haze. Our last day's march, before re-entering the mountains, was across the Terai. This belt of dense forest and swamp extends, as is well known, for hundreds of miles along the base of the Himalayas, varying in breadth. From June till November its climate is deadly. During the rest of the year it is comparatively healthy, when game of many sorts and sizes, from a jack-snipe to a wild elephant, may be found there, not to speak of the mahseer-fishing in its rivers. There is always, however, a feeling of restraint when boxed up in a howdah, as well as a certain amount of dependence upon the elephant that carries you and the mahout who drives

it, which, in my humble opinion, detract much from the enjoyment of this style of sport; and from the close heat of the atmosphere and the thickness of the jungle, it can hardly be either pleasurable or properly achieved in the Terai on foot. For my part, give me mountain work, with its freedom of action, glorious scenery, and fresh bracing air, and with one's own wits and limbs only to depend upon in pursuit of game.

After a rest at the mountain sanitarium of Nynee Tāl, with its deep clear Tal, or lake, lying embosomed among its beautiful surroundings of steep wooded slopes and moss-grown crags, a few days more through the mountains brought us to our recruiting station, and, I may add, my first hunting-ground in the Himalayas, after a long hot journey to it of about 750 miles.

Crossing a "jula."

CHAPTER II.

THE outpost of Shore, or Pithoragarh, as it is officially termed, at which I had arrived, is situated in a pretty, basin-shaped, green valley, about eight miles in circumference, at an altitude of somewhat over 5000 feet. The valley is encircled by high hills, except where a wide gap to the north-east discloses a beautiful glimpse of the snowy range. The post consists of a small British-built fort, and a stockade perched on an adjacent eminence; a few native shops; the huts for the detachment quartered there; and three dwelling-houses for the officers.

Black bears and other large game were plentiful at that time on the neighbouring heights, and hill-tigers and leopards were not uncommon. One grand hill, immediately south of the valley, and rising about 3000 feet above its level, was especially famous for game—the Thakil by name, so called after a singular kind of palm-tree that grows on it, and seemingly peculiar to that hill, as I observed it on none of the neighbouring ones. Its bare straight stem, topped with a bunch of feathery, fan-shaped fronds, has a rather anomalous effect, shooting up singly, to a height of 30 or 40 feet, here and there among gnarled old oaks, rhododendrons, and conifers, at an elevation of between 6000 and 8000 feet above sea-level, and more especially in winter when the hill is covered with snow.

On the evening of my arrival I had been dining with the officer commanding the outpost, who was then the solitary

European resident at the place,—and any of his contemporaries in the Bengal Presidency who may chance to read this, will wot how well and amusingly I was entertained by my host, poor Frank Crossman, who has long since joined the “majority.” When bidding me “good-night,” he laughingly expressed a hope that I might not be disturbed in the house where I had taken up my quarters, as it was reputed to be haunted. There certainly was a deserted, dismal look about the place, which was anything but inviting. Long rank grass and weeds grew in great profusion around it, and the walls, which in many parts were falling to decay, were green with damp and moss. Within a few yards of the house there stood an old dilapidated tomb, which, report said, had been desecrated by some ruffians who had exhumed the corpse interred long ago beneath it, in search of plunder. There were many other queer stories concerning the locality, one of them being of a quondam occupant of the house having, in a fit of “D.T.,” committed suicide there; possibly the individual buried under the ruined monument. Altogether, from its lonely situation, the supernatural tales concerning it, its general woe-begone appearance, which was augmented by some funereal-looking pine-trees that grew hard by, and the fact of the natives being loath to visit it after nightfall, it might indeed have been considered a ghostly sort of place.

Not being of a superstitious turn of mind, I thought little more about the reputation of my abode; and, being rather tired after my day’s journey, was not long in turning into bed, and was soon soundly slumbering. I must have been asleep some time, when I was awakened by a hand, as it were, touching my foot. The room was dark as Erebus, and I had no matches at hand wherewith to strike a light. Nor was there anybody within hail to bring one, for I was alone in the house, all the servants having left it for their own quarters, which, as is usual in India, were outside; so there was nothing for it but to lie still and try to collect

my somewhat confused ideas. My first thought was of the last words of my host at dinner regarding the reputation of the house ; my next was that perhaps he might be playing a joke, for it was well known how dearly he loved one. Meantime I could feel fingers, as I imagined, moving slowly and stealthily up my leg and on to my body. I must confess I now underwent that most unpleasant flesh-creeping sensation which most persons at some time or another have experienced. And when the seeming fingers at last reached my head, and I felt them stirring my hair, which by this time was assuming an upright position, I could bear it no longer. Throwing off the clothes, I sprang from the bed, but only to hear a rustle on the floor-matting as my nocturnal visitor pattered off in the dark. Little more sleep did I get *that* night, for the unearthly noises which went on through the house were enough to have awakened the Seven Sleepers of Ephesus. The place was haunted, and no mistake, in one way at any rate ; but after that night never a ghost did I hear or see there—nothing but the rats, with which it was prodigiously infested, rampaging about it ; and to these, after a time, I got quite accustomed. Next morning at breakfast we had a good laugh over my mysterious experience ; but whether ghost or rat was my visitor that night, I have never to this day been able to determine.

But let us now commence business with the Himalayan black bear, called *bāloo* or *veech* by the natives, which is common everywhere on the middle and lower ranges. Why it is termed *Ursus Tibetanus* in natural history I never could quite comprehend, as it is distinctly a forest-loving beast, and most unlikely to be found on the bare table-lands of Tibet, where it is never heard of.

It was early in the month of September when one morning news was brought in of a bear that had been committing depredations in some corn-fields a few miles off. There happened at the time to be several sportsmen at Shore, all

eager for shooting of any kind; so we at once proceeded to beat up Bruin's quarters.

On reaching a deep, broad ravine filled with thick brush-wood, to which the raider had retired to digest his morning meal, the various guns were quietly posted in the most likely places on each side, and at one extremity of the cover, whilst across the other end were ranged a number of villagers who, on all being ready, were to commence beating through it.

At last the appointed signal is given, and is immediately followed by a hideous chorus of yells, whoops, and whistles, as the beaters dash into the covert like a pack of fox-hounds. But there is little doubt that this ostentatious display of zeal results more from the idea that the greater row each man makes the less chance will there be of the bear's coming near him, than from eagerness in its pursuit. Presently a loud "wugh," "wugh," is heard above the clamour, and conflicting exclamations of "Kubberdar!" (look out), "There he goes!" "Here he comes!" are heard from the beaters in every direction; so that, at first, it is difficult to form any idea as to where the brute really is.

"Crack" at length goes a rifle, and a responding "yeeough" from Bruin sounds as though something more than the report had caused it. Other shots follow, accompanied by cries of "lugga!" "lugga!" (he's hit), "maro!" "maro!" (shoot), uttered by the villagers in their half-frightened excitement. Gradually the rumpus approaches my station near the extremity of the jungle, where each moment I expect the animal to bolt. But he breaks away on the opposite side of the ravine, and fully a hundred yards off. I take a snap-shot at his great black carcass as he gallops clumsily along between the bushes, its effect being to elicit another grunt and make him roll over. This may perhaps result only from fright, as, on recovering himself, he appears to go faster than ever. Having thus far run the gauntlet of the guns, he takes his way down the rocky bed of the stream, along the bottom of

the ravine, which becomes narrower and more free from bushes.

The business now gets pretty exciting, and not altogether free from the danger of stray bullets, as we all go scrambling along over the rough, uneven ground on either side, firing shots whenever an opportunity offers, but seemingly with little effect. At last I manage to get a fair chance at the brute's broad back, about twenty yards off, as he attempts to climb the opposite bank, when a bullet between the shoulders brings him rolling down into the water. At the same moment my foot slips into a deep hole hidden by long grass, and down I go, giving my knee such a painful wrench that I take little more heed of the bear. Even had he been able to show fight, I was almost *hors de combat*. But this shot had finished him, which was some little compensation for being laid up for many days after.

In localities where oak-forests abound, perhaps the pleasantest if not the best time for shooting these bears is in the month of December, when they wax fat on acorns, which are then ripe. They generally commence feeding about sunset, when they climb up the oak-trees and gorge themselves with acorns all night, often not betaking themselves to their lairs—which are generally either caves or thickets near their feeding-ground—until some time after sunrise. Their whereabouts is easily discovered from the broken branches showing distinctly against the dark foliage of the trees, the back of the leaf of the Himalayan oak being white. At the commencement of the acorn season their attention is so much engaged with their feast that usually they are easily approached. But on suddenly finding themselves “treed,” their astonishment is sometimes ludicrous to behold.

Early one morning I was strolling along a ridge commanding a view of a wide deep hollow, filled with oaks and thick underwood, keeping a sharp look-out for sign of Bruin, and occasionally stopping to listen for the snap of a branch. Suddenly the wished-for sound was heard away down in the

hollow. After a careful study of the trees, a patch of black was detected among the leafy branches near the top of a very high one. Having carefully noted the spot, I stole quietly through the heavy jungle towards it—Kurbeer Goorung, my Goorkha henchman and shikaree, following closely with my second gun. Every now and then we stopped to listen and to examine the trees, but nothing could we either see or hear. We were beginning to think the beast must have winded us and decamped, for Bruin's olfactory powers are exceedingly acute, when we were rather startled at hearing a sort of humming moaning sound close to us. Kurbeer, in a whisper, suggested that it might possibly be a tiger, for we had observed the fresh tracks of one in the vicinity. Instinctively we both placed our backs against the trunk of the nearest tree, and anxiously peered around into the thick dark jungle. We had been standing thus but a few seconds when something wet came dropping on to my head. On looking upward, there, in the very tree we were under, was the object of our search—

“In shape o' beast ;
A towzie tyke, black, grim, and large,”—

like a spread-eagle among the branches, gazing wistfully down at us, and looking the most absurd picture of astonishment and concern at being thus disturbed at his breakfast. We were not long in standing from under *that* tree. A shot from each of us—for the lad was too excited to withhold his fire—brought the brute straight down with a thud to the ground, where, after one or two whining grunts, he succumbed to his fate.

A bear, when up a tree, even if only slightly wounded, never attempts to clamber down. It invariably flops straight on to the ground from any height whatsoever. I once saw a bear I had shot at roll over and over like a ball down an almost perpendicular declivity for several hundred feet, and seemingly without much inconvenience from its tumble, as it was nowhere to be found at the bottom.

The black bear of the Himalayas is not so pugnaciously inclined as its concoloured relative the sloth-bear (*Ursus labiatus*), which inhabits the hilly districts and jungles of other parts of India. The latter animal is a cantankerous brute, that will often attack on the slightest provocation, and sometimes seemingly out of mere "cussedness." Whereas the former generally tries to escape if possible, even when wounded, and seldom shows fight except as a last resource, or in defence of its cubs.

I have killed and wounded many a bear, but can only remember one instance, and that rather a mild one, to record of my having been regularly charged by a black Himalayan Bruin.

One evening I had discovered a she-bear and her half-grown cub up an oak-tree growing just below the brow of a steep hillside. But the old one had already detected me below, so, leaving her offspring to take care of itself, she quickly cleared out of the tree, and, before I could get a shot at her, had disappeared over the brow. The youngster, not being quite so knowing, took longer in getting down, and so gave me a chance of putting a bullet through his hide, which made him "tune his pipes" pretty loudly, and sent him scampering away down the hill. The cub's cries of distress soon brought its mother back over the brow to the rescue, when she came tearing down the steep slope straight for me, grunting out her wrath in a most savage manner. I waited until she was within fifteen yards or so, and then gave her the contents of the second barrel. This at once doubled her up, her impetus causing her to tumble heels over head close past me. After rolling some way down the hill, she recovered her legs, struggled on a short distance, and then fell to rise no more. I never found out what became of the bereaved cub, but in all probability it did not long survive its dam, as it was hard hit.

On moonlight nights a shot may sometimes be got by watching places where the bears come to feed on the crops

from a *machān*. This construction is a small platform of sticks, either raised on poles at a safe height from the ground, or on the branches of some convenient tree, where

“On sentry” in a *Machān*.

the villager is wont to sit on sentry with his matchlock, or as often to fall asleep at night, by way of protecting his crops from the ravages of wild animals. But the chances are so doubtful that “the game is not worth the candle.” One of the many tales told by my native followers round our camp-fire, was of a villager who paid dearly for playing a practical joke in personifying a bear. Enveloping him-

self in his black blanket, and imitating the noise of a bear, this man one night entered a corn-field with the playful idea of testing the courage of the tenant of the *machān*. The watcher promptly let drive with his matchlock, and inflicted a wound from which the practical joker died.

It is a marvel how a cunning old Bruin will sometimes contrive to hide his big black carcass in a tree, so well as to avoid detection. Of this I had a fair example when I camped out and spent Christmas-day with my shikarees among the *feræ naturæ* in the woods, there being no compatriot with whom to pass that festive time then within sixty miles of the outpost. Kurbeer and I had been trying to circumvent two jurrow-deer, which, having got wind of us, made off. As they were trotting away past an oak-tree, I chanced to notice that some of its branches were violently shaken. Being just the end of the acorn season, we con-

jectured this phenomenon was traceable to a bear up the tree, so we stole quietly towards it in order to have a closer inspection. I had almost passed the tree, having taken, as I thought, a quite careful enough survey of it to be able to discern a large black object like a bear, when a low whistle from Kurbeer, who was following a few paces behind, caused me to stop, and, on looking round, I saw him pointing towards the middle of the tree. We moved closer under it, and there, behind a thick part of the stem and some closely interwoven branches, I discovered a patch of black hair of the cunning beast, which evidently thought itself well concealed. With a view to turning its flank, I moved to the right and left of the tree, which was unassailable from its far side, where it overhung a deep drop. But from nowhere could I get a better sight of the brute, which kept quite still during all my manœuvres. I therefore decided on risking a shot at its only vulnerable point, hoping to make its resting-place so hot as to induce it to drop from the tree, and then get a chance at it *en route*. I fired, and down came Bruin in a monstrous hurry. There was no occasion for a second shot, as the black patch was the neck of what turned out to be a large she-bear that had managed to hide her body so cleverly.

Never having tasted bear-meat, I suggested to my cook that he might add a morsel of it to my frugal Christmas dinner. But the horror and disgust depicted on his face at the bare idea was such a caution that I refrained from pressing the matter, so it never appeared at table. Although these bears are usually clean feeders, their food chiefly consisting of grain, fruit, roots, and suchlike, they are decidedly carnivorous. They will sometimes destroy sheep and goats, and will greedily devour carrion. Honey is perhaps their favourite food, and to obtain this they are sometimes so bold as to rob the village beehives, which are formed of short bits of tree-trunks, hollowed out, closed at the ends, and slung under the wooden eaves of the houses. Small

blame to them for being so fond of it, for the Kumaon honey is the purest and has the whitest and thinnest comb I have ever seen.

Bear's flesh is never, so far as I know, eaten in India, except by the Doms (a very low caste of hill Hindoos—in ancient times the slave class), although tiger's flesh is often used as a charm. One of the wonderful properties the natives believe it to possess is that of its making their children grow up brave if they partake of it in their youth. The whiskers, too, are regarded as so potent for working evil with, that if they, and also the claws, are not carefully looked after, you are sure to find the former either singed off or plucked out and the latter extracted surreptitiously by your camp-followers. The following anecdote, related to me by an old Central India sportsman, is a curious instance of superstition respecting tiger's flesh.

A dead tiger had been brought into camp, and all the native followers, except one, seemed anxious to secure some of the flesh. The exception was an old shikaree of the wild tribe of Gonds. On being questioned as to why he did not wish to take his share, he replied, with an expression of disgust, that he never ate tiger's flesh, but would enter into no explanation as to why or wherefore. After a little persuasion, however, and the promise of a glass of grog, the old man at length agreed to join the party at the camp-fire after dinner and relate his story, which, being freely interpreted, was much as follows: "My grandfather and grandmother were once encamped on the outskirts of a jungle, near a great city, when one day they saw issuing from the city gate a grand hunting-party, riding on elephants with silver howdahs and gorgeous trappings, and escorted by armed retainers mounted on splendidly caparisoned horses. My grandmother, being struck with envy, exclaimed, 'Why should we Gonds, whose forefathers were the lords of this land, now be reduced to such poverty and live in the jungles, whilst this upstart race enjoys such wealth and luxury?

I will change myself into a tiger and watch the city gate, and carry off every rich man I meet until I have amassed wealth enough to enable us to resume our former position, and then return and show you where I have buried my riches.' That night the old woman arose from beside my grandfather and went into the jungles, and as she has never since been heard of, she must still be amassing riches in the form of a tiger; therefore, if I eat the flesh of one, I may be devouring a bit of my grandmother."

Most probably the old woman did enter the form of a tiger that night, but as its supper. Anyway the old Gond did not seem to mind killing his grandmother, though he objected to eating her, for he said he liked slaying tigers, because the more of them he destroyed, the better chance there would be of one of them being his ancestress, who might then assume her original form, and return with her riches.

Fables innumerable about bears are common among the *pāhārees* (hill-men), and they are often amusing from their utter absurdity. The occasional abduction of women from the villages by bears is firmly believed in, as is also their being able to use a branch of a tree held between their paws as an offensive weapon, and suchlike nonsense.

Before concluding this matter-of-fact dissertation on black-bear shooting, I would venture to offer the young hand a hint which may save him the loss of many a wounded bear; for Bruin's vitality is such, that unless he is struck in the proper place, the amount of lead he can carry away is astonishing. A bear, after being skinned and decapitated, looks very like a corpulent man with short muscular limbs, and its vitals lie in much the same region, with regard to its shoulders, as those of a human being. It is flat-chested, and its fore-quarters are straight and placed far forward, so it is necessary to plant your bullet a good span behind the shoulder, and pretty high up. This, of course, only applies when there is time for a deliberate aim and a good position

for taking it from. These can generally be got if the animal is not approached from windward, for Bruin is as dull with his visual organ as he is sharp with his olfactory one. I have lost many a bear by shooting *at* its shoulder, but seldom or never since I learnt from experience where the most vital spot lay—provided I was able to plant a bullet there.

Village beehive.

CHAPTER III.

THOSE who have fished both for salmon and mahseer will doubtless agree with me in thinking that they are nearly on a par as far as sport is concerned. In its habits the mahseer much resembles the salmon, except that it never migrates to the sea, but in appearance it is very different. The mahseer (*Barbus Tor*) of Himalayan rivers, which is said to belong to the carp family, is a beautiful fish both in form and colour, but in flavour it does not approach the salmon. Yet its firm white flesh is by no means to be despised for the table. On the back its hue is a dark olive-green, shaded off, on the sides of a well-conditioned fish, into a golden orange, which merges into pale pink and silvery white below. It has rather large toothless jaws lined with a very tough membrane, so it requires to be struck pretty hard to be properly hooked. When I say *struck*, I mean that after the fish has hooked itself, as it will do by its own weight, a good pull, without a jerk, is necessary to drive home the barb into its leathern jaws. Owing to this toughness of mouth, a mahseer when fixed is seldom lost unless it breaks the tackle. This a big fish often will do in its first plunge, when it sometimes has a way of lashing its tail over the line. That crisis being safely over, if your tackle is trustworthy, landing your fish is usually only a matter of time and patience. Its strong teeth are set far back in its gullet, and the stoutest tackle has a poor chance if it gorges your lure beyond them. It cannot be easily clipped, as its large round scales are so hard that the

sharpest gaff will glance off them. When running a mahseer after it has been fairly hooked, I have never known it leap from the water, and I think it rarely does so, but its long and rapid rushes quite equal if they do not surpass those of any salmon of a similar size. As regards its weight, I am well within the mark when I state that the mahseer reaches nearly, if not quite, 100 lb. The largest mahseer I ever heard of as having been taken with a trolling bait, was 93 lb.; and with fly, one that turned the scale at 62 lb.¹ But such monsters as these are very seldom landed with the rod.

My reason for drawing comparisons between the salmon and the mahseer is chiefly because the latter is sometimes

The Mahseer.

termed the "salmon of Indian rivers." It might just as well be called a cod, for in truth it more resembles one, barring its scales, both in appearance and in flesh. It does not even belong to the same family, for I may safely assert, on good authority,² that no fish of the Salmonidæ tribe exists in any of the Indian or even more northern waters south of the river Oxus, although there are fish very much resembling trout taken in Indian streams. But let us now try and catch our mahseer.

Towards the end of September I started with a brother

¹ The 93-pounder was killed by Mr H. Vansittart, C.S., in one of the rivers of the Dehra Doon; the 62-pounder in the Poonch river in the Punjab, by the late General Sir Herbert Macpherson, who was as keen a sportsman as he was a good and gallant soldier.

² The late Dr Oldham, Superintendent of the Geological Survey of India.

sportsman and keen fisherman, Lieutenant F——, who has since become one of my truest and dearest friends, to try our luck in the Surjoo, a fine fishing-river within easy reach of Shore. There was also a possibility of getting a shot at sambur, here called "jurrow"—the big deer termed *Rusa Aristotelis* in natural history—which were plentiful in the heavy jungle that covered the steep hillsides flanking the river. It was rather doubtful whether the water would be in good fishing order so soon after the periodical rainy season, then barely over, and during which the Himalayan streams are in a perpetual state of muddy spate. The long, rank vegetation, too, would still be so luxuriant there as to make our chance of being able to see even a big beast like a jurrow in it most uncertain. But we were so weary of the monotony of indoor life that we resolved to take our chance, either of sport or fever, whichever it might be, the latter being most probable at that season in these low-lying jungles.

After a hot tramp of about twelve miles, ending in an abrupt and rough descent of several thousand feet, we reached the Surjoo about noon. It looked a perfect fishing-river. Here it surged and foamed among rocks and huge boulders, there it widened into swirling expanses of deep water, forming a succession of the most splendid streams and pools a fisherman could desire to behold. From its shores of sand, gravel, or rock on either side, rose steep lofty acclivities clothed with dense jungle. This gradually changed its tropical character to that of the more temperate and higher altitudes, as it spread far up the mountain-sides to where they became more craggy and steep. Here the fir, the oak, and the rhododendron took the place of the Kyer (thorny mimosa), the bright-green Sāl tree, and the luxuriant tropical undergrowth that flourishes below. The tiger and leopard found a safe harbour in the lower jungles, but from their being able so easily to slink away unobserved in the long grass and dense underwood, they were very seldom met with; although

the deep-toned voice of the former, or the succession of hoarse grating sounds—like the sawing of wood—made by the latter, might often be heard through the still night air. There also the jurrow-deer sought refuge from the fierce noonday heat, among tangled masses of the gigantic creeper called “maloo” or “maljoon,” beneath the impenetrable shelter of which it delights to ruminate. The crags and precipices above were the haunt of the “gooral,” or Himalayan chamois as it is sometimes called.

After an *al fresco* repast, for which our appetites had been sharply whetted by a refreshing dip in the river, we prepared our tackle under the grateful shade of the trees, before proceeding to business later in the day, for the sun’s rays in this low-lying valley were overpowering.

Towards evening, when the heat became less intense, we commenced proceedings in a splendid pool where the Surjoo forms a junction with another fine stream. But our hopes of success that evening were small, for the water was too big, and in colour too “drumlie,” as they would have said north of the Tweed, and “the fush wadna force.” We, however, plied it most perseveringly with every kind of fish-lure we possessed, until darkness brought our fruitless efforts, for that day, to a close.

On our return we found that one of the Goorkhas we had with us had been more successful on the hillside than we were on the river. He had taken one of our rifles and had managed to bring down a good jurrow. This fine large deer is identical with the “māhā” of the Terai, and the “sambur” of other parts of India. It affects heavy forest or its immediate vicinity, and is widely distributed over Hindustan from the higher ranges, close to the perpetual snows, to Cape Comorin. The colour and texture of its pile, which nature has adapted for the various climates of the localities where this animal is found, differ considerably. The prevailing hue of the stags is, however, a dark slaty brown, the throat and neck being covered with long wiry hair. The colour of the

hind is of a lighter brown shade, and she has less of the long hair, resembling a mane, on her neck. The jurrow of the higher Himalayas has a darker and thicker coat, and it is also provided with a close undergrowth of very soft pile, called pushum, which in winter is common to all the quadrupeds of those high cold regions, even to the dogs and horses. Having shot all the so-called three varieties, I am certain that, in point of appearance, this is the only difference between them, and in habits they are the same. Though not unlike the British red-deer in shape, the jurrow is very much larger. But it seldom or never has more than three regular points on each horn, though occasionally it may have one or two extra snags. I possess a pair of jurrow horns which measure forty-two inches in length, with an average girth of beam of eight inches, and a span of a yard inside the bend. But such a jurrow head as this never fell to my rifle, and seldom, I imagine, to that of any one else. The eyepits in this deer are always large, and become much more open and protuberant when the animal is in an excited state.

The little barking-deer (*Cervulus aureus*), also termed rib-faced deer, from the peculiar formation of the frontal bone, and called "kakur" by the hill-men, was common in these forests. It is found in most Indian jungles, and, like the jurrow, from the higher ranges downwards. In Madras it is known as the "jungle sheep," and I believe it is identical with the muntjac of the more eastern parts of Asia. It is rather smaller than a roe-deer, and bright red like that animal in its summer coat. Its head is curiously shaped, that of the buck being surmounted with two continuations of the V-shaped ribbed bone of its forehead, about two inches long, and covered with skin and hair. From these grow the horns, which in a full-grown buck are three or four inches in length, curved inwards at the top, and with one short prong just above the burr, projecting to the front and slightly upwards. Although I have seen numbers of this curious little deer at all seasons, and killed many of them myself with

horns of divers lengths, from a little sprout above the burr to their fully developed size, strange to say I have never found them in velvet. From this I am inclined to think they do not shed their horns regularly like other horn-bearing Cervidæ (excepting the "cheetal" or spotted deer—*Axis maculatus*—which drops its horns very irregularly, as I shall hereafter endeavour to show), even if they do so at all. But upon this point I cannot speak with certainty. The upper jaw of the buck is provided with a pair of sharp canine teeth, which sometimes project quite half an inch over the lower lips. For what use they are intended is uncertain. An old shikaree, whose veracity I had no reason to doubt, told me that he had once come upon two bucks fighting: one of them was soon left disabled on the ground, when he observed it had a deep cut in its back, evidently made by the tooth of its opponent, but whether purposely or accidentally he could not tell. This pretty little animal is most frequently found in thick cover interspersed with patches of cultivation. In the latter it may often be found feeding very early in the morning or late in the evening, but generally so close to the cover that in the grey dawn or twilight it is often not detected until the white of its stern is seen bobbing away into the bushes, from whence its short sharp bark comes at intervals, as if deriding its pursuer for not having kept a better lookout. When hurrying off, it sometimes makes a succession of clicking sounds, but whether with the teeth or hoofs I have never been able to ascertain. The doe is similar to the buck, with the exception of the continuations of the frontal bone, the horns, and long teeth.

We had foolishly brought no tent with us, having intended to get our men to extemporise some sort of shelter of boughs and grass cut with their "kookeries,"—those useful national weapons which the Goorkhas invariably carry, and use as much for domestic as for fighting purposes. But we had not even that to protect us from the heavy night dew, as on our return from fishing we found that

almost all the men were away up the hill fetching the dead jorrow, and it was too late when they returned to commence it. We, however, indulged in a stiff jorum of hot whisky-

Kookerie, or Goorkha knife.

toddy before we retired to rest, as a precaution against the damp malarious night air. When I say retired, I mean that we merely rolled ourselves up in our blankets, and, in order to avoid the heavy drippings that fell like rain from the trees, lay down on an open patch of soft dry sand, in which, by the way, we had noticed during the day the fresh footprints of a tiger. But—

“Inspiring bold John Barleycorn,
 What dangers thou canst make us scorn !
 Wi’ tippenny we fear nae evil ;
 Wi’ usquabae we’ll face the devil !”

Consequently we thought little of tigers, malaria, or anything else, and were soon wrapt in profound slumber.

On awaking in the morning, we found ourselves enveloped in a cold damp fog, through which we could scarcely see twenty yards, and with our outer coverings and even our hair saturated with moisture. Being down in this hot humid valley at all in September, about the worst time of

year for malaria, was tempting Providence, as I learnt from subsequent experience. But we were young and thoughtless, caring little for any risk so long as there was a chance of sport.

Having shaken ourselves up, we performed our ablutions in the river, which ran within a few paces of our sandy couch. After a cup of tea and a biscuit, we started each to our respective work; my companion electing to try his luck at the river, whilst I, wishing him "a tight line," took the hill after deer. Owing to the thickness of the undergrowth and the dense mist, there was very little chance of seeing game, although the fresh tracks of jarrow were numerous. And when the mist was dispelled by the rising sun, the sweltering heat was so oppressive as to make climbing about the steep jungly hillsides, in such close steamy atmosphere, next thing to impossible, not to mention the attacks of myriads of biting insects. On returning I found my hungry chum clamouring for a late breakfast, and much disgusted at having lost a very heavy fish after he had run it for about half an hour.

In the cool of the evening we were both at the water again. After trying flies and trolling baits all to no purpose, we were at last reduced to the more prosaic method of bottom-fishing with a lump of dough kneaded together with wool to make it adhesive. To this, at the suggestion of an old Goorkha whom we had brought with us, a great authority on mahseer-fishing, was added some turmeric and garlic. These pungent ingredients, he said, made the bait more attractive. With this odoriferous compound, I managed to inveigle two nice mahseer of seven and eight pounds. My companion also killed a fine fish in the same sorry way, which was better than nothing.

That evening we fared sumptuously on venison-soup, fish fresh from the river, savoury though perhaps slightly tough jarrow steaks, followed by hot whisky-toddy and a pipe, to both of which latter we doubtless partly owed our immunity

from the effects of malaria. We turned in on the old spot, having this time taken the precaution to have a "lean-to" constructed to shelter us, and were soon lulled to sleep by the roar of the river close by.

We shouldered our rods again as the dawn was trying to struggle through the dense mist. For in the morning, during the autumn and winter months, a heavy bank of white vapour almost invariably lies along the bottom of every deep, narrow Himalayan valley where any considerable stream flows, until dispelled by the sun's rays. The water looked more promising, so our spirits as well as our chances of sport began to rise with the lifting fog, which at first was a decided damper to both. It requires but little reference to my old shooting journal to call to mind all the details regarding the killing of my first really fine mahseer.

"Take a rest for a little while, and try again when the sun gets higher." Thus suggested old Chundreea—a native of the valley, and fisherman by profession, who usually attended me by the river-side—as I was getting rather impatient with my bad luck, and my back was beginning to ache from chastising the water with flies, and spinning live baits the whole morning without having moved a fish. Following the first part of his advice, I reeled up, sat down on a rock, and pondered as to whether it would be worth while acting on the last part of it. After I had consoled myself with a pipe, and Chundreea had adjusted a fresh *chilwa*,¹ I again waded into the river, and loosening a good handful of line, dropped the bait as far across the swirling pool as possible. I have him at last! Hardly has the *chilwa* commenced spinning in the water when I feel a heavy pull, which is immediately followed by a splash and a boiling swirl. Bob goes the point of the rod, and "whir-r-r" out runs the tightened line, almost smoking in the rings as it flies from off the reel, which is whizzing and humming with

¹ A beautiful silver-scaled little fish—the minnow of Indian waters.

an impatient, irregular cadence, as if angrily remonstrating against the rough treatment it is forced to undergo. Those few moments of thrilling excitement repay me in full for all my enduring patience. But it suddenly strikes me that I am between the two rivers, and only a short distance above their junction, beyond which I shall be unable to follow the fish; and I am fully aware that if he once reaches the heavy and broken flood of the combined streams, there will be but little chance of my ever landing him. Consequently I am rather nervous and anxious about his intentions, and feel considerably relieved in mind when he suddenly stops. After remaining almost stationary for a while, jerking and tugging away at the hook until each moment I expect to part company with him, he commences boring upstream, and then takes to sulking in the deep water, where, for a long time, he feels like a log on the straining line, which is vibrating like a harp-string against the strong current.

All that can now be done is to get Chundreea to pitch stones in his vicinity. This soon has the effect of inducing the fish to alter his tactics, and the reel resumes its remonstrances as he recommences careering away in such a frantic manner that I again begin to experience those qualms of fear and hope which, mingled with intense excitement, make the sport of angling so fascinating to its votaries. My tackle, however, is stout and trustworthy, and this enables me to take a hard and steady pull on him, in order, if possible, to keep him above the junction; so much so that Chundreea, who is anxiously watching the tussle from the shore, seeing the heavy strain on the bending green-heart, begins shouting, "Let him run, Sahib, let him run, or he'll break the rod!" But under existing circumstances I well know that such a proceeding will be as likely to prove fatal as holding him too taut. After several more mad rushes and plunges for freedom, his cantrips become somewhat subdued, and ere long he begins to show signs of submission.

As I gradually reel him in, I can, for the first time, catch an occasional glimpse of his form looming largely through the water, and the sun glints now and again on his golden scales as he rolls helplessly about. At length I am able to tow him towards a good landing-place, where, after his making some of those last desperate wriggling efforts to get free, during which a fish is so apt to be lost after all, Chundreea bestrides him, and carefully lifting the struggling, shining beauty by the gills from the shallow water, proudly carries him ashore, and throws him kicking among the stones on the bank.

My scaly prize was at once weighed, and found to be 26 lb. This restored my flagging hopes, and I was soon fixed into another fish, which took out the line with such a swish and fought so hard, that at first I thought it equalled the first one in weight, and not until it had been on some time did I discover that it was little more than half as big. But not even another rug did I get that day. There is nothing like patience for fishing, and nothing like fishing for trying it.

Next day the river rose again from the effects of heavy rain higher up, and somewhat resembled the colour of potato-soup. We found, too, that it was not the best time for the Surjoo valley, as the warm and steamy atmosphere, biting flies, &c., made sport there, at that season, more toilsome than pleasant. The months of March and April are, I think, the best for mahseer-fishing, as the climate is then more pleasant and healthy in these low valleys than during September and October—the best autumn months—and the fish in the mountain streams more readily take the fly, and are in better condition in spring. It is said that on the days which succeed moonlight nights, mahseer are not so readily taken as they are after moonless ones; and, strange to say, they are generally more easily moved on bright sunny days than on dark cloudy ones. The flies that seem to suit their taste as well as any, are bright and gaudy ones that show well in the water, like

the "Jock Scott" or the Dee "Gordon," of various sizes up to at least $2\frac{1}{2}$ inches for big fish, and perhaps one with black wings tipped with white, and black hackle and body ribbed with silver, for a complete change. But, like salmon, they will take almost anything when they are in the humour, and will look at nothing when they are not. I have not implicit faith in fishing theories respecting either salmon or mahseer, for I have often killed both fish under circumstances which are ordinarily considered most adverse. For instance, in Canada one evening I was fishing when it had grown so dark that only by the bright flashes of lightning could I see where my line was; yet I fairly hooked and landed a salmon of 9 lb. whilst the thunder was rattling around like great guns. I should like very much to know why the salmon of the western rivers of North America are so difficult to kill with the fly, whereas in the eastern rivers they take it so freely. One thing, however, is quite as important in mahseer-fishing as in fishing for salmon—namely, the size of flies to suit the state of the water; but when the angler has constantly to be changing his fly, depend upon it there is something wrong—and that generally lies more with the humour of the fish than with the fly.

CHAPTER IV.

NOWHERE can a finer or a more invigorating climate be found than at an altitude of between 6000 and 8000 feet in the Himalayas, during the three months that succeed the clearing up of the rainy season—about the end of September. The wild animals, too, are then in their best condition both for fur and flesh. The males would of course be better for food a month or so earlier; but as the natives highly prize venison at any time, it is never wasted; and the trophies, which the sportsman values more than the meat, are none the worse for the delay.

The November mornings were crisp and frosty, and the days bright and clear, when I set out on a short hunting-trip of quite a different character to the one just described. My small retinue consisted of Kurbeer and another Goorkha lad carrying the guns, a cook, and four or five "coolies" (native baggage-porters), laden with a little tent, bedding, and the few requisites for a short sojourn in the wilds. We reached our destination—a hamlet near the foot of the hill we intended hunting over—in time to get everything "fixed up" before dark.

On making inquiries about a guide for the ground, the village Nimrod—a comical-looking little man attired in an old black blanket, with a bit of rope round his waist supporting a small "koolharee" (wood-axe)—presented himself, and made his salaam. This bare-legged individual rejoiced in the name of "Baloo Mar," literally meaning "Bear-killer," which

sobriquet had been given him, I was told, by some former employer. Not that he had earned it from the fact of his having performed any daring feats in the destruction of Bruin, but from his having the reputation of making himself scarce at the first symptom of any dangerous intention on the part of the said animal. However, as he was reported to know the country and the haunts and habits of its game pretty well, I employed him, and found that in this respect at any rate he did not belie his calling, besides being a cheery, amusing little man.

The Himalayan native shikaree is, as a rule, a perfect cragsman, an excellent stalker, and an adept in woodcraft generally. His power of vision, too, is marvellously acute; and his capability for quickly detecting game, either in thick cover or far off in the open, is sometimes astonishing. If he errs, it is in his endeavouring to get so close to game that, unless you are capable, as he is himself with his bare legs and feet, of moving as noiselessly as a cat, it usually precludes anything but a snap-shot; and should the ground be precipitous and broken, sometimes not even that before a beast, on being alarmed, can get instantly out of sight, and is often out of range ere it reappears, if it does so at all. For wild animals, when they suddenly detect danger very close to them, are so terrified that they make off like an arrow; whereas, if it is farther from them, they will often stand

*Village Shikaree, with matchlock and rest.
Province of Kumaon.*

and gaze in doubt, giving ample time for a steady aim, or stop to look back after going a short distance.

After dinner, and a pipe beside the camp-fire, I turned in pretty early, as the "bear-slayer" had informed me that if we expected to see "gooral" we must be up near the summit of Dhuj *teeba* (hill) about sunrise. Before proceeding further in search of the *Nemorhædus gooral* of natural history, a slight sketch of this "Himalayan chamois," as it is sometimes called, may not be out of place. The ordinary height of a full-grown buck is about 28 inches at the shoulder. The colour of its short rough coat is usually a uniform greyish brown, with a white patch on the throat. Its legs are sturdy and goat-like, and of a darker brown than the body.

Both sexes carry short black horns, those of the full-grown buck being sometimes 7 inches or so long, annulated from the base to about half their length, and slightly curved backwards. The doe is similar to the buck in appearance, except as regards her horns, which are thinner, smoother, and shorter. I once saw the skin of a pure albino

Head of "Gooral," or Himalayan chamois.

gooral which was shot in the Kumaon hills. The natives who lived near its haunt had a superstitious idea that the killing of this animal would be attended with bad luck to the slayer. And, strange to say, the experienced and well-known sportsman who shot it, on the same day met with a serious gun accident. This curious coincidence is no camp-fire yarn, for the sportsman was an old and intimate friend, and I saw him shortly after the accident happened. The gooral is found all over the Himalayan ranges, from the higher to the lower and outer ones, but seldom below an altitude of 3000 feet, and always on craggy and precipitous

ground, which may or may not be more or less clad with forest.

As the terms *lower* or *outer*, *middle*, and *higher* or *upper*, are so frequently used in these pages to distinguish the various mountain-ranges of the great Himalayan chain, when describing the haunts of game, I may mention that the first apply to those rising directly from the plains or from the Terai; the second, to those more in the interior of the mountains; and the third to the spurs of the snowy range, and the precipitous, either open or forest-clad, slopes immediately below it. The "snowy range" needs no definition. But to revert to our pursuit of the game little gooral.

I had seemingly been but a very short time asleep when my slumbers were rudely disturbed, and I was informed that Baloo Mar was waiting to accompany me up the hill. After the usual cup of tea and a biscuit, we were soon climbing the steep ascent, where our way led up through forest of oak and rhododendron, or over open grassy slopes which were white and crisp with frost. As we neared the summit, just before sunrise, I could not resist the temptation, or perhaps, from having "bellows to mend," I should call it the inclination, to sit down and cast a look over the succession of mountain-ridges and deep trough-like valleys stretching away far and wide between us and the mighty frozen barriers of the snowy range. Some of the highest pinnacles had already begun to flush up with that exquisitely beautiful but utterly indescribable tint of delicate rose assumed by snowy summits when touched by the first gleam of morning. Gradually the ruddy glow spread from peak to peak, and grew brighter and more yellow, until the whole jagged line became suffused with golden light as the sun rose over it in dazzling glory and threw its slanting beams across the profound misty depths of the intervening hollows.

The bear-slayer being of a decidedly practical turn of mind, and also blessed with a first-rate pair of "bellows," did not seem to appreciate these charms of nature, but kept

reminding me that we should be too late for our game if we did not hurry up. As we resumed our ascent, we soon became aware of the presence of a gooral, by a succession of short, sharp, sneezing sort of sounds which we heard above. The animal had been watching us whilst I had been viewing the scenery. We caught only a glimpse of it ere it vanished among the wooded crags. A gooral, when alarmed, almost invariably emits this sound, which is something like that made by pronouncing the word "tschick." If in doubt as to what the danger may be, it will often perch itself on some prominent point, and remain there for a considerable time with its head turned to the suspected quarter, hissing out its note of alarm at short intervals. But when once fairly satisfied of its danger, you may bid good-bye to it. I do not think the sense of smell is so acute in the gooral, nor in any Himalayan animals of the wild-goat family, as it is in those of the deer tribe: this is, however, in a great measure compensated for by keen powers of sight and hearing.

But we have now reached the crest, and here we call a short halt for breath before examining the open precipitous ground on the south side of the mountain, where the shikaree says we shall be pretty sure to find our game. We are soon on the move again. As we near the brink of the declivity, Baloo Mar creeps stealthily forward and cautiously looks over it. By the careful manner in which he slowly withdraws his head, and the self-satisfied look he turns towards me, I can tell he has sighted something. Crawling quickly up alongside him, on peering over I have the satisfaction of seeing four gooral browsing unconcernedly on a grassy slope among some broken masses of rock directly below us. Being a tyro at mountain shooting, I am suddenly seized with a severe attack of what, in the backwoods of America, I have heard termed "buck fever"; so without taking time to judge the distance, or to allow my fast-throbbing pulses to subside, I raise the rifle and let drive at the nearest animal.

The result is, of course, what might be expected under such circumstances—a clean miss of an easy shot. The gooral, however, from the fact, I suppose, of their not having been recently disturbed, are only startled, and stand gazing about them as if undecided as to what course they should pursue. This serves only to augment my complaint, causing me to fire the second barrel almost at random, when the animals, being no longer in doubt, make off. The bear-slayer's look of satisfaction now gives place to one of bitter disappointment and ill-concealed contempt for my performance, and on his face I can plainly read that which, if he could only have given vent to his thoughts, in modern English might have been, "Well, you *are* a duffer!" But there is still another chance, for one of the beasts, a fine buck, not even yet seeming quite satisfied of his danger, bounds up on to the point of a projecting crag, where he stands balancing himself on all four feet planted close together, sneezing out his warning note. Drawing back under cover, I recharge my old muzzle-loader as quickly as my trembling hands will permit, whilst the shikaree remains impatiently watching our game. On again looking over, I find the buck has moved up nearer us, and is now within fifty yards. This time I take a more careful aim, and on the smoke clearing away, I have the delight of seeing the gooral rolling down the precipitous hillside, until stopped by some rocks below.

Baloo Mar was not long in reaching the dead buck and bringing him up. He now proposed that, as it was getting late in the morning for the animals to be out feeding, we should return by a different way to the one we had come up, and on which there might yet be a chance of finding more game. After lightening it of its paunch, he shouldered our prize, and, notwithstanding his load, set off as fast as the rough ground would admit of, stopping now and again to rest, and to take a look round about for any sign of game. We had not gone very far before we started another gooral from where it lay reposing among the crags, after its morn-

ing feed. A whistle caused it to stop, as a startled beast often will do for a few seconds, to listen and look back on hearing any sudden and unusual sound behind it. Off it went again, but this time hard hit, and, as is the wont of animals of the wild-goat kind when wounded, took to some very bad ground, where it lay down. We did not attempt to follow it, for my guide wisely remarked that if we disturbed it again then, we might never get it; whereas if we let it alone, he would return to look for it in the afternoon, by which time it might be less inclined to move, when there would be more certainty of securing it. We therefore took a bee-line for camp down through the thick forest of oak and rhododendron that usually covers the northern slopes of the middle and outer ranges.

The evening was devoted to beating up some patches of cover in the vicinity of the terraced fields¹ near our camp, where I bagged a brace of Kalleege pheasants. The Kalleege is common in most parts of the Himalayas. The cock is black, with grey hackles and crest, and the hen brown. As several varieties of this bird can be seen in the Zoological Society's Gardens in London, it is needless to describe it more fully.

The men who had gone after the wounded goral returned with it at dark. They had had considerable trouble in securing it in the difficult ground where it had betaken itself to. As the night was bitterly cold and logs were plentiful, we lit a huge camp-fire. This was always done whenever wood was procurable. And many a pleasant hour have I passed beside it before turning in for the night, smoking my pipe, and listening to the marvellous tales and adventures related by the mountaineers, some of which were as amusing as they were incredible.

Next day we tried other ground, on which I made a clean

¹ In the Himalayas the villagers always cultivate their crops in small fields arranged in flat terraces, one below another, in such a manner as to allow of their being irrigated from some neighbouring stream.

miss at a goral and lost one wounded. We came upon a sounder of wild pigs, but did not manage to circumvent them. The "bunneyl," as the hill-men call it, is frequently met with in these mountains, where "pig-sticking" being impracticable, it may be considered fair game for the rifle, and native shikarees think a solitary old hill-boar quite as ugly a customer to deal with as a tiger. The only game bagged was a "cheer" pheasant, a handsome bird something resembling our own hen-pheasant, but lighter in plumage and larger. It is generally found on the higher hill-tops of the middle and outer ranges, among wooded crags. Although cheer are never very plentiful, they are, as a rule, easily shot when found, but they sometimes lie very close among long grass or bushes. On coming by chance across a brood of cheer, when after larger game that I did not care to disturb by firing, I have even flung stones at them as they sat among the rocks, before they flew. But they are not always so easy to find when wanted, as I know from the time and trouble it once cost me to secure a single good specimen, which I was very anxious to shoot for a collection of Himalayan game-birds I was trying to make before I left Shore.

There was a craggy hill-top a few miles off, known as the Drill-peak—so named, it was said, from an eccentric commandant of the outpost having been in the habit of punishing his defaulters by sending them, in heavy marching order, to the summit and back, whilst he watched their ascent, with a telescope, from his quarters. This hill was reputed to be an almost certain find for these pheasants about dawn; so one morning I turned out several hours before daylight, and started with Kurbeer for its summit. On reaching our ground, just as morning broke, sure enough we heard the cheer calling loudly, and seemingly quite close below us. But after searching for them among the long grass for hours, we had to return without having seen a feather. Next morning we repeated the experiment, with

the same result. I was, however, amply repaid for my trouble by a most singular and beautiful sight. As the grey morning dawned, there appeared, stretching away below us, a perfectly level and unbroken expanse of mist—except where some craggy hill-top, like a rocky islet, protruded—completely hiding everything beneath it, until it was, seemingly, terminated by the irregular line of peaks and ridges of the snowy range, which, in the dim uncertain light, had the appearance of a rugged frozen coast abruptly rising from the ocean. This extraordinary spectacle was of short duration, and was succeeded by another almost as strange, when the sun, after gilding the higher peaks, rose over the sea of mist, which began to heave and toss itself into huge billows, as it were, until it gradually wreathed itself about the hill we were on, and enveloped us in its cold damp folds.

As I was sure the “cheer” must be somewhere on the hill, I was determined not to be beaten by them; so the third morning I took two or three men with me to mark the birds from below, in case they flew downwards before it was light enough for us to see them from above, as I thought they must have done on the previous mornings. I had in some way mistaken the hour, and reached the ground much too early; consequently we had to wait there shivering with cold until daybreak. As the first streak of light appeared, the cheer began their whistling call as usual, and still our search for them was fruitless. When it grew light enough to communicate with the markers, we learnt from them that the whole brood had flown from the top of the hill, and had lighted in some broken bushy ground below. We had beaten all over this, and I was just about to give up the pursuit as hopeless, when one of the men flung a stone into some bushes where we had marked down a black partridge, and out flew a cock-cheer. The sly old rascal gave me a long shot, but a single pellet in the head at last secured me my troublesome specimen. A good dog,

had I then possessed one, would have probably done in an hour what I took so long to accomplish without one. I may here, by way of parenthesis, remark that dogs kept in these mountains very frequently end in becoming food for a leopard. I have known a leopard so bold as to take a dog actually from the doorstep of a room in which his master was dining, and the table attendant passing constantly to and from the kitchen outside through the doorway. This happened at the travellers' bungalow at Ramgarh, in Kumaon.

Another bird of the pheasant tribe is the "koklass." It is to be found in almost every oak-forest, where its loud crow may often be heard in the early morning. The handsome plumage of the cock is grey and dark brown. The female is something like our own grey hen, and, I should judge, about equal in weight. On the same kind of ground, the mournful whistle of the wood-partridge comes at times from the dense thickets and bushy dingles it affects. The "pewra," as the natives call it, is a game-looking bird, of a general dusky olive hue, from which it gets the name of "olive partridge," as it is sometimes termed.

Having made such a long deviation after one cock-pheasant, let us return once more to our hunt after better game.

On the third morning, the bear-slayer having mistaken the star by the rising of which he determined the time for our start in the dark, aroused me much earlier than was necessary. Being thoroughly awakened, I turned out, stirred up the log-fire, and made the best of it until it was time to set out. We had got about half-way up Dhuj, when there was a sudden stampede of heavy animals near us in the forest. At first we could see nothing in the deep gloom under the dense dark foliage of the oak-trees—for the morning had not as yet dawned, and there was only the pale dim light of a waning moon. "Hist! there's a *mirrig*,"¹ whispered Baloo Mar, as the form of a jurrow

¹ *Mirrig* is a term applied by the natives to any large game-animal except bears, tigers, and suchlike.

loomed indistinctly on the crest of an open knoll close above us; but whether a stag or a hind we were unable to make out, owing to the background of dark trees beyond it. Although I could not discern the sights on the rifle, I chanced a shot without them, and heard the unmistakable sound that a bullet makes when it tells on flesh. The rest of the herd went thundering away through the wood, where it was too dense and dark to see them, although they must have been within fifty yards of us. It was useless to look for the wounded beast before daylight; so we continued our ascent. We had reached the top of the hill, and had been examining the precipitous craggy slopes on the south side for gooral, when one of my companions suddenly crouched down, and, pointing with his finger, in an excited whisper ejaculated the word *Bāloo!* On looking in the direction indicated, there, sure enough, was a big black bear clambering about among the rocks and grass about a quarter of a mile off. He had evidently come out of the forest on the north side, and as he was not far below the crest of the ridge we were on, if he remained there only for a short time I saw he could be easily stalked for a near shot. We therefore retired quietly into the wood, and made our way round through it as fast as the broken nature of the ground would allow of. After some rough scrambling and climbing, we reached the spot we had marked on the ridge, where we judged we should find our friend Bruin pretty close below us. I had crawled on to a ledge of rock to look over, when I almost met the brute as he was scrambling up the rocks *en route* for the wood, fortunately without his seeming to observe me. I tried to cock the rifle, but the hammers refused to move. Kurbeer and Baloo Mar were endeavouring to make themselves as small as possible behind me; and the brave slayer of bears, seeming neither to like such close proximity to Bruin nor to understand my delay in firing, kept urging me, in a trembling stage-whisper, to shoot. Meanwhile the bear had

reached the crest, and was moving along within a few paces, just below us, beside the ledge of rock we were on,—and still, strange to say, without detecting us, or the consequences might have been unpleasant; for we were now between him and the precipice, and a tussle with Bruin under existing circumstances would have been decidedly in his favour. At this juncture it suddenly struck me that in my flurry I had forgotten to remove those worse than useless old appendages, the so-called “safety”-bolts, from the hammers. I had only just time to withdraw them, and to give the brute a slanting shot behind the shoulder, before he disappeared with a grunt down among the trees on the back slope of the hill. “*Ne lugga!*” (not hit,) exclaimed Baloo Mar, jumping up most pluckily now that all possible chance of danger was over. Kurbeer and I, however, thought otherwise; so, after reloading, we commenced tracking, and soon found the long grass bespattered with blood, which increased in quantity until we found the bear, a large male, lying stone-dead about three hundred yards down the hill. But the bear-slayer was determined to make sure that there was no possibility of doing harm left in the animal; for he flung several stones at its carcass, and also took the precaution to repeatedly prod at it with his long stick, at arm’s-length, the while heaping a variety of abusive epithets on the defunct beast, before venturing to go nearer it.

After covering the dead bear with boughs and long grass to hide it from the eagles and vultures, we made for the spot where I had wounded the jurrow. But after tracking it for a long distance, we eventually lost all sign of it in the thick forest to which it had betaken itself. The afternoon was spent in skinning the bear, and removing and boiling down the grease, of which the beast had a pretty thick layer on its broad back.

The early part of next day was devoted to the gooral. The only one I shot at fell down a considerable distance among the crags, so I sent Kurbeer after it. On his return with it,

he told me that whilst below he had seen a surrow. As I shall have more to say about this curious animal hereafter, I shall now merely describe its appearance as being something between a donkey and a big billy-goat, with short black horns. We returned rather early, as I intended to organise a drive for the jurrow, which I felt sure was lying wounded somewhere in the wood into which we had tracked it.

We beat up for volunteers in the neighbourhood, and soon had enough of willing hands for our purpose. The village dogs of all sorts and sizes were also, at Baloo Mar's advice, put into requisition. Some of these mongrel curs, queer as they looked, were quite up to the business on hand, for the villagers often use them for hunting down jurrow, especially during winter, after severe snowstorms, when these heavy deer, from being unable to travel fast in the deep snow, are easily driven down to the foot of some deep gorge, and there mobbed by their pursuers, who despatch them wholesale, regardless of sex or size, with axes, sticks, and stones, in default of better weapons. Although the hill villager never loses an opportunity of killing jurrow in defence of his crops as well as for food, they have an equally inveterate foe, in common with most Himalayan game-animals, in the wild dog, *Cuon rutilans* of natural history. The "bhowsa," as it is here called, usually hunts in smaller or larger companies, and will follow its prey with most deadly pertinacity and cunning manoeuvring, until the whole pack closes round its devoted quarry, of which it makes short work. Even the striped king of the forest is said to dread the presence of the bhowsa on his domain. Should the hunter find that a pack of wild dogs has been sharing the sport in the same locality with him, he may as well strike his tent and make for other ground. But we shall now see what the more domestic members of the canine family can do in the same line of business.

Having mustered our small army of bipeds and quadrupeds, we started for the wood, which soon rang with shouts and whistles as the line beat through it. On getting about

half-way down, it was evident, from the increased uproar of the beaters and the barking of the dogs near the centre of the wood, that something was afoot there. On reaching the spot, we found the wounded deer lying in a pool of water in the steep rocky bed of a stream, with the curs baying around it. The defenceless creature, a big milk-hind, was unable to rise, for, in addition to a smashed leg from the bullet, she had broken another among the slippery wet rocks, in her endeavours to escape from the dogs. I was stricken with remorse at seeing the poor animal lying helplessly there, with her large mild eyes turned reproachfully, as it were, on her persecutors. It was a cruel lesson to me, and never to be forgotten, and one from which much might be learnt in the cause of humanity. By this I do not mean that even here, where the predatory animals keep them down quite fast enough, hinds should never be shot—and good yield hinds killed in proper season are not the worst of venison,—but I allude to the wanton, indiscriminate destruction of game at all seasons—an unsportsmanlike practice which, I regret to say, is by no means uncommon in a country where there are no strict laws in force to prevent it, and one which has ruined sport in many easily accessible and much-frequented places, where game was formerly abundant. With the smaller animals, such as gooral and kakur, it is not always easy to discern the gender to which they belong; but with jurrow and suchlike large game this can seldom be mistaken.

After the deer had been put out of its misery, I left the men to bring it down, and straightway returned to camp in a mood that was more thoughtful than elated, although I must confess to a pardonable amount of satisfaction at having found the wounded hind. There was a good deal of wrangling about the distribution of the spoil. But all was amicably arranged by my two Goorkhas, who divided it with their kookeries into small equal portions, and distributed it fairly as far as it would go.

Before returning to Shore I had another successful day at gooral, killing one of two animals I shot at right and left.

Gooral-stalking in the precipitous and broken ground on the middle ranges, is perhaps the pleasantest, though not the grandest, kind of mountain sport. The amount of stiff climbing it entails is quite enough to give it zest without making it excessively laborious. The sportsman can generally return to his tent to rest during the heat of the day, whilst the gooral are doing likewise, hidden away among the shady recesses of the rocks, and he can always get back at night to a comfortable bed. Moreover, in a good locality, one seldom has to score the toilsome blank days that are not uncommon on the upper ranges, and are frequent, I may say, beyond them, on the bleak dreary uplands of Tibet. After the experience of hunting every sort of Himalayan game, my own predilection for this kind of shooting may be deduced from the fact of my finding sixty gooral recorded in my Himalayan game-register, as having been fairly stalked and shot with the rifle, which, with the numbers I lost and missed, represent many a day's genuine sport after these game little animals.

Shooting-tent.

CHAPTER V.¹

BEFORE relating my own experience of it, I shall endeavour to describe one of the methods of killing jurrow, which is often resorted to by Himalayan native shikarees at the season these deer make their nightly raids on patches of young corn which may be situated near their haunts. The hunter first finds out a "run" or track by which jurrow are in the habit of making their way through the forest to their feeding-ground or elsewhere. This is easily discovered, as it is usually well defined, from the animals so often taking the same one. He then selects an open spot, on a ridge if possible, over which the "run" leads. Here he digs a small shallow hole a few inches wide, and in it moistens the loose earth by a natural action. He sometimes throws some salt on the wet earth, but he generally considers this an unnecessary bit of extravagance. The deer, in passing, are attracted by the odour, and, like most animals, being partial to anything of a saline nature, finding this on their path, generally stop and partake of it.

This operation is repeated at intervals by the shikaree, until in a few days a hole sometimes a foot or so deep is caten down by the deer. Each time he visits the *kar* (salt), as he terms it, he obliterates the footprints around the hole, so that he is generally able to ascertain about the number

¹ The first part of this chapter, as also portions of chapters viii., ix., xiii., xiv., xv., xvi., were contributed by the author, years ago, to the 'Oriental Sporting Magazine,' published at Calcutta.

and the size of the animals from the tracks and their appearance.

Having in this manner discovered that the deer have become regular nightly visitors, he proceeds to prepare an ambush within a few yards of this artificial salt-lick, taking care, as far as possible, not to make it in the direction of the prevailing wind. He generally digs a hole in the ground, or in a bank should there be one conveniently near, and over the entrance makes a careful covering of grass-sods or earth, leaving only a small aperture to look and shoot through. By this arrangement the deer have not the means of so easily winding him as when merely hidden behind a screen of bushes or of cut boughs; and also, if there is no moonlight, an animal's body can be seen in dark relief above him against the sky. The result is what may be expected. As the native shikaree seldom wastes a charge of his precious ammunition, the lord of the herd, or at any rate the largest hind, generally bites the dust.

I have tried this artifice, but without much success; for although I heard the deer come quite close enough to the *kar* to prove the efficacy of the plan, they generally managed to get wind of me in some manner which prevented my getting a shot. And it requires such an amount of patience, and sometimes endurance on a bitter cold night, that the doubtful result hardly repays one for the trouble, not to mention its being rather a *dirty* way of doing business. On one occasion, however, I had the luck to get a chance at one of the finest jurrow I ever had the pleasure of pulling trigger on.

An old Goorkha, a shikaree whom I was in the constant habit of employing, was the first to initiate me in the mysteries of preparing one of these artificial salt-licks for deer. Old Jeetoo was about the best shikaree I ever came across. He was one of those men who talk little and do much, and had such a quiet business-like way of doing things withal. He was like a steady old hound, for his voice was seldom

heard without good reason, and from being somewhat deaf, he seemed to anticipate one's intentions from one's looks.

One day I was surprised to see his long grave visage and gaunt figure at the door, for he seldom left the vicinity of his home except for shikar. He had come to inform me that, if I cared to sit up for it, he could almost ensure my getting a shot at a large stag with horns "like trees," as he described them, that came and ate the *kar* every night, not far from his village. The few traps necessary were soon packed up, and after a tramp of about twelve miles, we reached a little hamlet, on the hill above which the *kar* was situated.

On arrival, just before sunset, I heard that a leopard had the day before killed a cow within a few hundred yards of the place. As one of the villagers had rigged up a kind of ambush in the fork of a tree near the remains of the carcass, with the intention of sitting there for a shot, I promised him a *douceur* for his chance of a shot, and at once proceeded to take up my post, to which I was followed by several men from the village. Against this latter proceeding I remonstrated, but Jeetoo set my mind at rest by informing me for what purpose they accompanied us. He said that as soon as we were ensconced in our ambush, they would set up a shouting as if with the intention of scaring any animal away from the carcass. This row they would continue to keep up until they got back to the village. The leopard, which was probably lying pretty near, hearing the noisy ones depart, and their clamour become fainter as it grew more distant, and thinking from this that all was now safe, would most probably return to its prey all the sooner, and more especially as it was beginning to get dusk. I at first laughed at the idea; but Jeetoo assured me that he had often been successful on former occasions when he had tried this ruse with tigers as well as with leopards, and I have several times since found it answer myself.

On arriving at the carcass we found that there was little of it left, save a few bones which the vultures had picked nearly

clean ; and I began to think that there was very little chance of our feline friend taking the trouble to come for so poor a supper. But as Jeetoo seemed confident that the beast would come—and he was seldom wrong in his conjectures regarding game—I determined to wait there, at any rate until dark. So, having mounted the tree, we dismissed our followers, who departed exerting their lungs to the fullest extent.

The bones were at the foot of a rock in a small wooded ravine on a steep hillside, and our position in a tree which grew a little below was almost on a level with them, and about twelve yards distant.

We had been watching for barely a quarter of an hour, and every minute darkness was growing apace, when I heard a slight rustle among the dead leaves, and felt Jeetoo gently pressing my arm. In a few more seconds I saw the leopard slink noiselessly up below our tree and look stealthily around. I might have fired at him then, but I waited until he reached the bones, making sure that I should get a more certain shot. On finding so little to eat, he commenced glowering about as if at a loss to know what had become of his leavings. Carefully I now began raising the rifle, but in doing so it touched an unlucky twig that chanced to be in the way. Slight as the noise was, it caused the leopard to start and look upward; and before I could close the stock to my shoulder, with one bound he reached the top of the rock above him and was out of sight. I sent a random shot after the brute, but never saw a sign of him again. I had "counted my chickens before they were hatched." My delay in shooting had lost me my chance. This little incident with the leopard, which may have served to illustrate one of the many hunting stratagems used in these mountains, has caused me almost to forget the *kar*-eating stag we had come out to look for.

After making an unsuccessful search for any traces of the leopard, I started on the following afternoon with Jeetoo for the place where he had reported the stag was to be

found, which was situated a short distance above the outskirts of an extensive oak-forest that spread itself over the northern slope of an adjacent hill. Our way led up over some broken ground, where I shot at and wounded a goral which I lost.

We reached the *kar* a little after sunset. As the spot was unfavourable for firing from the ground, Jeetoo had constructed a *machan* in a tree about twenty yards from the *kar*-hole. From the fresh marks around this it was evident the stag had paid it a visit the night before; and as there would be a bright moon, I thought matters looked very promising.

We had soon arranged our blankets in the *machan*, and had settled ourselves there pretty comfortably—in fact so much so on my part, that after watching for several hours I fell fast asleep. Such was not the case, however, with my trusty old companion, who had evidently been keeping his eyes, and his ears also, notwithstanding their deafness, wide open, for I was awakened by his giving me a gentle shake. How long I had slept I had no idea, but when I awoke the moon had risen high, and threw her broad tranquil light over the forest sloping away down below, and into the deep, misty valleys that lay one beyond another like mighty trenches between us and the distant rampart of perpetual snow, rising dim and irregular along the horizon. The night was bitterly cold, and so calm and still that one might have heard the fall of a leaf. I could hear my heart beating as I lay there, hardly daring to draw breath lest it might disturb the silence. No one but a sportsman can appreciate the feelings of a moment like this.

Suddenly a loud sound broke the profound stillness, and was so startling from its unexpected proximity that it almost brought my beating heart to my mouth. It was the short alarm-note¹ of the stag, and was followed by

¹ A totally different sound from his prolonged bellow during the rutting season.

several impatient stamps of his hoof. These signs were unpropitious, and, I feared, indicative of his having either winded or heard us. However, I lay there motionless, straining my eyes in the direction of the *kar*, in momentary expectation of his emerging from behind one of the patches of tall brushwood which grew close around. The loud short bellow was repeated at intervals, accompanied by stamping, which grew more and more distant, and at length ceased entirely. There was no longer any doubt about it,—the beast had detected us, and there was now little hope of seeing him that night, or in all probability for several to come.

At the first streak of dawn we clambered down from our airy lodging, benumbed and stiff from cold, and exceedingly mortified. But there was no help for it, so we took our way regretfully down the hill, hoping for better luck next time. I must say the sunrise over the snowy range, glorious as it was, had not the same charms for me that morning as it would have had under more cheerful circumstances. This, however, was not the last of the stag.

Thinking it unlikely that he would return to the *kar* for at least two or three nights, I shifted my quarters with the intention of, in the meantime, hunting gooral on some ground where I had often been successful. The locality was exceedingly wild, and the hillsides very precipitous and difficult to work over. And from the fact of there being no human habitation within miles, and village shikarees considering it too far to visit often, gooral usually abounded. We hunted there, however, for several days with little success. It seemed as if bad luck were to attend this trip throughout, notwithstanding the small offerings of copper coins, &c., old Jeetoo had thought it necessary to make, for propitiating the spirit of the mountain, at one of the rudely built little Hindoo temples that are so common on the higher peaks of the middle ranges. My thoughts were constantly reverting to the big stag, so we packed up and started to

revisit his haunt ; and the same evening saw my little tent pitched near some huts situated a mile or two below the place where we had watched the *kar*.

Next morning we were up with the dawn, and, after a stiff pull, reached the upper edge of the forest, a short distance above which the *kar*-hole was situated. Our intention was to inspect this, in order to ascertain whether the stag had resumed his nightly visits. Thinking it was now much too late in the morning to expect him to be there, we took no care in approaching the *kar*, when suddenly from behind the bushes close by it, out walked a lordly stag, followed by a hind, and presented himself to our astonished gaze at little over a hundred yards, neither of the animals, apparently, having as yet seen or heard us. Another second and the sight of my rifle was on the stag's shoulder, the report being followed by a "thud," and before the echoes of the shot had died away in the forest below, he had subsided in the long grass, leaving only his splendid horns and the tips of his ears above it. Thinking him secured, I commenced deliberately reloading the rifle, being at that moment in as happy a frame of mind as a mortal can ever hope for in this world. But alas ! I was doomed to bitter disappointment.

Perhaps it was the slight rattle of the ramrod in reloading that attracted his attention, for his horns began to sway to and fro, and almost immediately he jumped up and went off at a lumbering gallop. I had just finished recapping, so, taking a hasty aim, let drive, and in my hurry, with sorrow be it told, clean missed the great animal ; but, being very sick, he soon pulled up in a small strip of wood that extended for a short distance down the hill.

I now took Jeetoo's advice, contrary to my own opinion, with respect to taking up a position whilst he proceeded to drive out the wounded deer. My idea was to post myself at the lower end of the bit of wood, thinking that, as the stag was badly wounded, he would most probably take

down hill. But Jeetoo persisted that he would take upwards, so I gave in to his superior knowledge of woodcraft, in which he was seldom at fault; consequently I had the mortification of seeing the stag leave the cover almost at the spot I had intended posting myself. He made straight for the thick forest below, in which he disappeared from our sight. We followed at once on his tracks, feeling quite confident that, as he was so hard hit, we should soon overtake him. We came up with him several times, and got so close as to hear him crashing away through the bushes, but, owing to the dense cover, without getting even a glimpse of him. Here we had made another mistake in following him up too soon instead of allowing him time enough to lie down, when in all probability he would have given an easy chance for a shot.

For the greater part of three days did we slowly and perseveringly follow him, often finding clots of gore where he had stopped to rest. Jeetoo's tracking powers were truly astonishing. Sometimes, after losing all traces of the slot for hours, where it had led over rocky ground, my sinking hopes would be revived by his drawing my attention to an almost invisible speck of dry blood on a twig or a blade of long grass against which the animal had brushed in passing. The stag, however, baffled all his skill, and we were at length most reluctantly obliged to abandon the pursuit, where the tracks were irretrievably lost among a number of those of other deer, with which they had got confused.

Many a cold night-watch did old Jeetoo and I have together for game, although they were not often attended with success, as such work is very uncertain.¹ Something is, at

¹ For night work I have found the following a good method of aligning the sights on an animal. Stretch a broad bit of white tape along the rib of the barrels between the back and the fore sights, binding it at either end on the rib with a bit of thin twine whipped tightly round the barrels. Commence aiming with the tape well in sight, and with the muzzle-end of it rather above your object. Then gradually depress the muzzle on to the point you

any rate, occasionally added by night shooting to one's knowledge of the habits of *feræ naturæ*. For instance, I was under the impression that a tiger in its wild state always killed its food and never touched dead meat, until one of our nocturnal experiences proved that it will greedily devour even carrion.

There had been a dreadful murrain among the cattle throughout the district, and Jeetoo amongst others had lost many of his beasts. As they died he merely dragged their carcasses from his *gote* (cowshed) to a neighbouring jungly ravine, and there left them to rot, and, from fear of infection, without even stripping them of their hides. One day he came and reported that a tiger had been at them for several nights. At first I thought he might have been mistaken, and that the nocturnal visitor must be a bear. But he so positively insisted that it was a tiger, that I at once resolved to go and judge for myself.

On reaching the village, we forthwith proceeded to inspect the place where the dead cattle had been devoured, and there found the fresh unmistakable footprints of a large tiger. Jeetoo had already removed all the carcasses, except one, to some distance, in order that there might, for obvious reasons, be more certainty of getting a shot. As it was growing late in the evening there was no time to be lost. We hauled the carcass to a likely spot for our purpose, and tied it tightly to a stake driven into the ground, so that it could not be dragged away without giving time for a shot. Some green branches were cut and stuck upright to form a screen about fifteen or twenty paces from the carcass, and on slightly higher ground than where it lay. All being ready, Jeetoo and I took up our position in our ambush

wish to hit, at the same time lowering the eye until the tape is hidden from view by the back sight, on the required alignment, when at once press the trigger. By this means you can tell if the back and the fore sights are correctly aligned, whereas you are uncertain of this if, as is customary, the fore sight only is rendered visible by having a bit of white cotton or any other dodge fastened on to it.

about dusk, hoping that the tiger might put in an appearance before it grew too dark to be able to see him, as unfortunately there was no moon. We waited there until I could no longer see either my rifle-barrels or the dead cow in the pitchy gloom of the ravine; but not a sound broke the deep stillness except the intermittent "chunk, chunk" of the night-jar, so we quietly left our ambush. Shortly after returning to the village we heard at intervals the deep-throated "aowoongh" of the tiger on his way down from a neighbouring forest-clad hill to his supper. How wild and eerie it sounded in the silence of night! This was another new experience, for I had always thought that a tiger stole warily towards its prey. But in this case, the prey being dead, it perhaps thought such precaution unnecessary.

As it would have been as rash as it was useless to attempt to go after a hungry tiger in the dark, we waited until morning dawned, when we cautiously approached the carcass in hopes of finding the animal still at work on it. To our great surprise we found it had not been touched, though we discovered the brute's tracks close to it. We followed them for some distance, until we came upon another dead cow partially eaten, which the tiger had very recently left, as was evident from the freshness of his big pug-marks round about it. This was annoying, as Jeetoo had unfortunately overlooked this carcass, which lay concealed among the dense brushwood when he had removed the others.

As the shades of evening began to gather around, we fastened the two dead cattle together and once more took up our post. Whilst we silently watched there in the gloaming, the hollow moaning voice of the tiger was now and again heard on the hill above. Gradually the sullen sound drew nearer and nearer as the brute came prowling down, until it seemed to be quite close to us, when it ceased and was heard no more. It had now grown so

dusky that we were only just able to discern the outline of the carcasses, as, with bated breath, we crouched behind our ambush, listening for the slightest sound, and straining our eyes as we tried to pierce the deepening gloom. My heart beat faster and faster each time the light evening zephyrs stirred the loose leaves of some bush in our vicinity, until the feeling of anxious suspense became almost intolerable. We remained listening there, as if spell-bound, for some time after it had grown pitch-dark, expecting each moment to hear the crunching of the bones. At length my trusty old companion, in a whisper, suggested that it might be prudent for us to retire as noiselessly as possible from the ravine, lest the tiger should chance to prefer live to dead meat for his supper. Next morning we were again much astonished at finding our bait untouched. The wary brute must have got wind of us in some manner when he had approached so near, for no sign was either seen or heard of him about the dead cattle after that night.

Man-eating tigers are not uncommon in the Himalayas, but one seldom hears of man-eating leopards, although they are common enough in Central India. A hill leopard, when it does take to that sort of thing, is generally a very devil at it. A brute of this kind infested the Shore valley during part of the time I was there. It had killed some seven or eight people, and was so crafty that it baffled all attempts to destroy it. In one instance it was bold enough to carry off a little girl from the hut in which she was sleeping. Her people were so anxious to avenge her death and to rid themselves of this pest, that they came to the outpost and reported their having actually left the partially eaten corpse at the spot where the leopard had dragged it to, in the hope of the brute's destruction by a shot on its return to its victim. I was absent from Shore at the time, but a sportsman who happened to be there went and watched over the body, to which, as was the custom of this cruel and cunning brute, it never returned. Man-eating

tigers and leopards are often pale and dingy in colour, and mangy in appearance. This, however, is not due, as is commonly supposed, to their diet of human flesh, but to age. These pests are usually old and more or less infirm animals, which, finding human victims easier to obtain than more active and wary ones in the shape of deer or cattle, consequently take to habitually preying upon them.

On one occasion, during my sojourn in Kumaon, I had an exciting hunt after a perfect feline demon. I was on a visit at Almora, the capital town of the province, when a report was brought in that a leopard had temporarily established itself in some terraced rice-fields near a village about half a mile off. It had that morning given a forcible proof of its unwelcome presence there by maliciously attacking a woman who was at work in a field close below the village. Two or three sporting members of the small European community of the place were soon on the scene of action, and having collected a number of willing men from the village, at once commenced beating up the enemy's quarters. We had not proceeded far when several hoarse grunts, followed by the piercing screams of a woman, apprised us of the brute's whereabouts. It was standing on the edge of one of the terraced rice-fields lashing its tail from side to side and looking back defiantly towards us, and in the field immediately below lay the victim it had just seized and left. The beast was rather far out for the borrowed smooth-bore I was armed with, and fearing lest I might injure the woman I aimed rather high. At any rate the shot had the effect of scaring the leopard away from her vicinity, for it at once decamped. On reaching the poor woman, we found her lying there with her head and back all lacerated and bleeding, and speechless with fright and pain. Having arranged for her being carried to the village, we at once proceeded with the beat, all of us vowing vengeance against the brute for this its second cruel performance of the day.

After beating, as we imagined, most thoroughly through the rice-fields, we reached a bushy ravine, in which we all, with one exception, thought the brute must have concealed itself. The exception was a tea-planter who had joined the party. He was one of the best mountain-hunters, and about as cool a hand as I ever met, and quite a character in his way. Originally in the army, his predilection for wild sport had been the cause of his leaving it and taking to tea-planting and shooting in the hills. He now expressed his opinion that the leopard was still lurking somewhere in the rice-fields, and his intention of taking his chance alone of finding it there whilst we beat through the ravine. We had just begun driving it when I heard him shouting to us. Supposing he had seen the leopard and was calling us back, I at once ran up towards where he was standing with the butt of his rifle on the ground. To my astonishment and concern, on reaching him I saw that he was profusely bleeding from a wound on his face, and that his coat was all torn and bloody. With his characteristic coolness he quietly remarked, "He's boned me"; but from the expression and pallor of his face, I could see he was more injured than he cared to allow. It appeared that after our leaving him he had but just commenced wandering about in search of the leopard, when it suddenly sprang on him from behind, making its teeth meet in the upper part of his arm, and driving one of its claws into his face within an inch of his eye; and before he had time to use his rifle, even had he been able to do so, the beast had bounded away and was out of sight in a moment.

After bandaging up the tea-planter's wounds and arranging for getting him conveyed home, we renewed our search for the leopard. Although we beat about until evening, all our endeavours to find it were fruitless, nor was it again heard of in the vicinity. The hero of this hunt was not long in recovering from his wounds, of which, if he be still living, he bears the scars on his face and arm

to this day. With his usual erratic disposition, he soon gave up tea-planting, and wandered away elsewhere in search of adventure and wild sport. The last time I met the "Bhagee," by which *sobriquet* he was well known, he was with an expedition against the hill tribes on the north-west frontier, where, as an amateur, he had been "shooting plumb centre," as he termed it, at the enemy with his six-shooter. The injuries to the poor woman were fortunately more ugly than dangerous.

CHAPTER VI.

HITHERTO my Himalayan experiences had been confined to the middle and lower ranges, and I had regarded those aerial piles and peaks of eternal snow as a sort of distant dream-land, which I hoped some day to find a substantial reality; and for those who are not cragsmen born, so to speak, it may perhaps be as well to get accustomed and inured to mountain-climbing where it is comparatively easy and safe, before attempting to hunt among the dizzy heights and dangerous snow-slopes of the higher Himalayas.

It was the beginning of April when I purposed visiting the Chipla mountain, a gigantic rocky buttress, as it were, of the great frozen wall it seemed to support, and a favourite haunt of the "tähr." This member of the wild-goat family—*Hemitragus jemlaicus* of natural history—is plentifully distributed over the precipitous rocky slopes just below the snow-line, and is occasionally found on some of the higher parts of the middle ranges, where, however, it appears not to attain the same size as it does in the higher regions below the snowy range. I have never seen a more truly wild-looking animal in the Himalayas than an old buck tahr, with his long frill-like mane and shaggy coat of dark-greyish brown, short sturdy legs, and almost black face. His horns are from twelve to fourteen inches long, and about nine inches in circumference at the base, broad and flat, with their rough anterior edges rising in a line with the forehead till they abruptly curve backward to a very fine point.

When seen from the front, they somewhat resemble a high coronet. An old buck stands over three feet at the shoulder. The doe, called "tehrny," is smaller, lighter in colour, and less shaggy, with horns of the same shape, but much smaller than those of the buck. The great old bucks herd separately during the summer until October, generally betaking themselves to the wildest and most unapproachable places. Their colour is often so dark as, at a distance, almost to look black, more especially in the autumn. The flesh of the tahr, or "jhārrel," as it is sometimes called, is considered by the hill-men to be great medicine for fever and rheumatism; and shikarees often dry the flesh and sell it, and even the bones, in places where fresh tahr-meat is not procurable.

As it would be difficult to procure even the bare necessities of life in the wild thinly populated part of the mountains I was about to visit, my commissariat arrangements, &c., were this time made on a rather more extensive scale, and our party consisted of some nine or ten men all told, including Kurbeer. In two days we reached the village of Askote, the residence of a native potentate styling himself a "Rajwār"; and the third morning brought us to the Goree, a fine rapid river, which was then in a muddy state of flood from the melting of the snow-fields about its source. The only noteworthy incident that had hitherto occurred on our way, was the destruction of an enormous wild cat of a light sandy-grey colour, measuring 46 inches from tip to tip.

Thus far our road had been fairly good for a mountain bridle-path 5 or 6 feet wide. But after crossing the Goree, where it was bridged by a few tree-stems thrown over it at a narrow place between two rocks, we left the road and struck up the left bank of the river by a mere track. In some places our path lay close to the water's edge, in others it overhung the stream, and sometimes at such a height as, at first, to make looking down at it, surging impetuously along, rather unpleasant. That evening we sheltered,

coolies and all, under a huge beetling rock, from which retreat we had to eject, with the help of smoke, myriads of small black, biting flies, here called "peepsas" or "moras," very like the "black fly" of the Canadian woods, and just as troublesome. Their bite leaves, under the skin, a small blood-spot, which is very irritable.

Our way now led up beside a torrent that leapt from rock to rock as it tore furiously down a very steep gorge. After several hours spent in fording and refording this ice-cold stream where its sides were precipitous and impassable, and in assisting each other in clambering up difficult places, we exchanged this rocky defile for a stiff but less laborious pull up a steep wooded slope of the Chipla.

At length we reached an open space on the mountain-side, where the sloping ground was cultivated in small stony fields arranged in terraces. In these the inhabitants of the few log-built huts that were scattered here and there over this plateau, raised their scanty crops, just sufficient for their own wants.

As we were pitching our little camp on the plateau, we were interviewed by several of the tenants of the log-huts, who willingly offered to give us every assistance in the way of sport. Tahr they reported as abundant higher up on the mountain, and a few black bears and plenty of kakur (barking-deer) in the forest close above the plateau.

Next morning, whilst forcing my way through some tangled bushes, a twig I had pressed back with my hand flew back and struck me in the open eye, causing the most acute pain, and quite blinding me for the time of that eye. Being the right eye, this little accident proved highly detrimental to rifle-shooting for several days.

About noon we commenced our ascent to the haunts of the tahr. For a mile or two our way led through forest, and over ground that was rough and uneven owing to huge fragments of rock that had been detached by some bygone convulsion of nature from the heights above, and which

now lay jammed together where they had here found a resting-place below. Such travelling was tiresome for our laden men, though they made nothing of the difficulty. At length we emerged on to a rocky ridge which ran up the left side of a vast amphitheatre. From the naked crags and snow-streaked summits that almost encircled it, deep rifts, gullies, and broad landslips of stones and *débris* ran down its precipitous sides, until they terminated in a wilderness of partially wooded, rocky ravines far away below. Some idea of the proportions of this huge natural amphitheatre may be formed when I say that as we clambered along we might have been compared to ants creeping over the ruined walls of the Colosseum at Rome. Here and there amidst this chaos were steep verdant slopes, on which several small herds of tahr were quietly browsing or reposing, looking in the distance like little brown dots. Altogether it was a wonderfully wild scene to gaze upon, though I had only one eye for viewing it, the injured one being bandaged up for the time.

As we picked our way along the ridge, I was much amused with the behaviour of a big sturdy inhabitant of the plateau, who, notwithstanding his load, which was not a light one, was skipping nimbly about from rock to rock in his anxious endeavours to point out the tahr. Fortunately the animals were so far distant below us, that there was little chance of their observing his excited movements. On examining the animals with the telescope, I could discern no great old black fellows among them, only tahrny or young bucks. Some of the latter, however, showed fair heads.

We soon reached a spot on the ridge where the aforementioned stalwart individual, who had constituted himself our guide, had informed me that we should find a sort of cave, under a big overhanging rock, capable of affording shelter for us all. It was rather an awkward place to get at, from its being situated just below the crest of the ridge,

in such a way as to render it necessary to clamber down, one by one, on to this covered shelf of rock, below which was an almost sheer drop of at least a hundred feet, terminating with a very steep slope of incalculable distance towards depths unseen from above.

Taking with us our burly but agile guide, Kurbeer and I lost no time in making a start after the tahr we had seen below. Difficult as the ground looked from above, we found it fairly easy, although toilsome to work over. As it was very favourable for stalking, I had not much difficulty in getting several easy shots. But no sooner did I uncover my right eye to take aim, than its sudden exposure caused both eyes to water, blurring the sights of the rifle and everything beyond them, which of course made my shooting rather erratic. It was almost dark when we got back to our cave, and, much to the regret of its occupants—who had been looking forward to a hearty supper of tahr-meat—empty-handed. Notwithstanding the general disappointment, the place looked cheerful enough, and highly picturesque withal, as the fires blazed and crackled away, shedding a warm ruddy glow on the black, smoke-stained rock beetling above, and throwing up the wild figures of the mountain men, either in dark relief or in high light, as they moved to and fro, or squatted before their little fires, cooking their evening meal. After dinner and a pipe, my blankets were spread on the softest spot I could find on our stony floor. Fortunately I am not a somnambulist, or, from the position of my couch, my ambulation might have taken me down over the rocks below at a pace I never could have dreamt of.

Next day my eye was still so bad that it would have been wiser to have given it a rest than to have gone out merely to disturb the game as I did, by firing several random shots. Of course the natives ascribed my want of success to the protection from harm afforded to the game there by the deity of the mountain. I discovered one fellow who had accompanied me from Shore, smoking my rifle with

some burning stuff that he informed me was a charm with which he was endeavouring to exorcise the evil spirit he thought must have possessed it—for, he added, he never had known it behave so badly when he had been out with me on former shikar trips. The following morning, however, my eye being considerably better, such ideas were dispelled from their minds by my shooting a fine buck tahr, and also a gooral. The tahr was one of a herd of seven; but owing to the broken nature of the ground, it was not until after we had stalked quite close up to and shot him, that we caught sight of his companions as they scurried helter-skelter away among the rocks. My satisfaction at being, at last, able to kill some game on this ground, was added to by the opportunity it afforded of providing my friends of the plateau with some venison in return for their civility.

The game here had been so much disturbed by my wild firing, that I now thought it advisable to try fresh ground. About noon the loads were all packed and hauled up from the rocky alcove. The laden men descended along the ridge until they reached the lower extremity, as it were, of the amphitheatre, where the torrent that drained it rushed and tumbled down its rock-bound channel towards the narrow gorge we had, a few days before, ascended with so much difficulty from the river Goree to the plateau. Kurbeer and I took a more circuitous route down through the crags on the chance of finding game, but were unsuccessful. In the evening we found the camp pitched beside some huts near the stream, across which, and rising abruptly almost from the water's edge, was a very steep and rugged hill-face we intended scaling on the morrow.

In the early morning we crossed the stream and commenced the long and arduous ascent, which must have been some 5000 feet at least, and not a drop of water was there to be found on the way up. It was past mid-day ere we all had reached the top. The heat of the sun's rays, as

they beat on us through the clear air of those high regions, had been intense during our toilsome climb. I was nearly dead beat when I threw myself down in the shade of the rhododendron bushes that grew in great profusion along the ridge, and my mouth was as dry as a lime-kiln from thirst. But the glorious view from the ridge was a more than adequate reward for the trouble of getting up there. And the rhododendrons! which were all in full bloom—never have I seen anything to approach the colouring and quantity of their gorgeous blossoms. Here, almost at the limit of vegetation, they grow in the form of large shrubs—not as forest-trees, like those of the middle and lower ranges—and their bloom is larger, fuller, and of more delicate and varied hues. Some were white as snow, others of a salmon-red, whilst the tints of many ranged from the faintest blush of pink to the deepest rose. The bunches of blossom were very round, with the flowers on each bunch packed closely together. To see the rhododendron blooming in perfection of form and colour, one must visit the higher Himalayan ranges where nature alone has nurtured it.

After a short rest we trudged on refreshed and invigorated by the cooling breeze on the ridge. The rest of our day's work was comparatively easy, being more or less through forest and down hill. And how we did enjoy an ice-cold draught at the first sparkling stream we came to! As a rule, however, it is a mistake to drink water when out on the hill, for the more you indulge in it the more you seem to want, and you soon get inured to doing without it. It was late in the afternoon when we reached our destination—a hamlet situated below the ground we intended hunting over. Whilst dinner was being prepared, I arranged with the village Nimrod for his services as guide, and after quickly disposing of my frugal repast, at once turned in—for sitting up to promote its digestion was quite unnecessary after such a hard day's mountain work.

The fleecy cloudlets that flecked the deep-blue sky were

just becoming tinged with gold as I stepped out of my little tent into the bracing morning air. All traces of yesterday's fatigue were gone, and much to my joy, the sight of the injured eye was almost as clear as ever. At the shikaree's suggestion we left most of the *impedimenta* at the village, only taking with us a man to carry our blankets and food sufficient for the few days we intended passing on the hill. In consequence of these little arrangements having to be made, the sun had risen over the eastern snow-peaks before we had started.

"Look, there's a gooral!" exclaimed one of my companions in a hurried whisper, as he crouched down and pointed to where a buck was perched among some rocks high above us, basking in the rays of the morning sun. As his gaze was not directed downwards, he had evidently not observed us. The ground was favourable, so we had little difficulty in circumventing him, when a bullet sent him scrambling helplessly among the rocks. The shikaree was not long in securing him, and after slinging him over the few things he already had on his back, again took the lead upwards. Before we had gone much higher, three or four more gooral sped away up the crags. I took a snap-shot at one of them, which I missed. As we were going through a small birch coppice we flushed a pair of large beautiful birds here called "loongees," and generally known as the horned argus-pheasant. Its habitat is always on the higher ranges, where its wild peculiar call—a kind of mewling sound—may sometimes be heard issuing from thickets in the pine-forests and birch-woods near the snow-line. Being a very shy bird, it is seldom or never met with in the open.

About noon we reached a small kind of cavity among some steep rocks, where the shikaree proposed we should temporarily establish ourselves. After skinning and breaking up the gooral, I took a careful search over all the ground in view with the spy-glass. There was a small herd of young buck tahr far away above, near the sky-line;

but the steep intervening ground was so open, that there was no chance of getting near them from below, and it was too late in the afternoon to attempt to approach them from the ridge above, even had it been possible to reach it; we therefore proceeded to try our luck elsewhere. Two moving objects are soon descried on a distant grassy slope. Surely they must be great old tahr, for they seem almost black against the steep background of dried-up grass on the slope, which looks yellow and bright in the rays of the declining sun shooting athwart it over the high rocky ridge already in deep shadow behind us. On bringing the telescope to bear on them, they turn out to be wild pigs rooting about among the grass. As wild pork is more esteemed by the hill-men than any venison, we at once resolved to try for a shot. After a long, tiresome, round-about stalk, we find, to our chagrin, our porkers vanished. It was now getting late, and our fruitless endeavour had taken us a long way from our lodging, so we made for it as straight as possible, lest darkness should overtake us on ground where travelling was by no means easy, even in daylight. By the time we got back, the shades of night had closed down on the mountains, their rugged crests rising black and grim against the clear starlit sky.

After rekindling the fire, our supper of gooral-meat was soon frizzling away on wooden skewers over the glowing embers. The small share of our airy lodging I had appropriated for the night was rendered somewhat uncomfortable from having a sharp immovable bit of rock sticking up in it, which, from the limited space, I was unable to avoid; but after a hard day's clambering, such trifling inconveniences do not interfere very much with one's slumbers.

The moonal pheasants were whistling loudly among the adjacent crags when we sallied forth in the grey dawn. My only shot was at an old cock-moonal, which offered so tempting a chance, as we suddenly came on him where he sat, whistling away on a point of rock below us, quite

unaware of our presence, that I could not resist such a rare opportunity, even at the risk of disturbing better game, for on open ground these birds are usually very wary. A wire-cartridge sent him whirling from his perch so far down among the rocks that it was hardly worth while fetching him, as his plumage was destroyed in his fall, and he turned out to be as tough as an old shoe. Nothing else was seen except a few tehrny.

Moonals are often a great nuisance on tahr ground, where they are almost invariably numerous. Sometimes an old rascal will, on observing the stalker, set up his loud alarm whistle, and thus warn the tahr of impending danger, making them restless and suspicious, and consequently more difficult to approach.

Towards the afternoon it began to rain pretty heavily; we therefore returned to our lodging for shelter. By way of employment we commenced digging out the lump of stone that had made my couch so unpleasant. This we found no easy matter, as it proved to be much larger than we expected. After a good deal of work we managed to loosen it, when, with the help of wooden levers cut for the purpose by Kurbeer with his kookerie, we launched it over the mountain-side, down which it went hurtling and crashing, smashing and carrying away everything that impeded its headlong course, until it disappeared from our sight in a deep dark gorge far below, where, as it dashed against rock and tree, an occasional sullen boom was heard, the sounds and their echoes growing fainter and more faint until they were no longer audible.

After the rain had ceased it was too late to go up after tahr, so we tried for gooral lower down, returning at dark only to score in my note-book "a blank day."

At daylight next morning we sent down our spare man with the blankets, &c., giving him instructions to have the traps we had left at the village taken by a lower route to our next camping-place. At the same time Kurbeer, the

shikaree, and myself started with the intention of hunting over the heights above and joining the camp in the evening. Much of the ground we had to get over was decidedly bad. On some of the steep slopes we traversed the grass was, at this season, so dry and slippery as to make the foothold very precarious, and they, as often as not, terminated abruptly on the brink of a sheer precipice. I must say I was rather staggered at the look of one very awkward place we came to, which there was no means of avoiding. As seen from below, it appeared to me to be a nearly perpendicular craggy precipice of at least fifteen hundred feet high. But our guide said it was quite practicable, and as it had to be scaled, there was no use looking at it—for the more one looks the less one likes such a place,—we therefore commenced the ascent. It was not so difficult, however, as it at first appeared, except in a few places where one or other of my companions had sometimes to place a hand from below on the nearly vertical face of some smooth rock for a step; there were juniper-bushes, too, here and there by which we could hold on. On nearing the top, it was decidedly unpleasant to look back, and I was very glad when we reached it. I was then but a neophyte in mountaineering on the upper Himalayan ranges, or I should probably have thought little of such a climb.

“*Kustoora!*” suddenly ejaculated Kurbeer, just as we topped the ascent. A musk-deer had jumped up close to us, and was standing at gaze on the ridge. All breathless as I was, I fired, and felt sure the animal was hit, although it made off. We soon discovered it standing on a little ledge of rock below the brow of the ridge. I could easily have finished it with another shot, but if it fell from the ledge there was nothing to prevent its going to the bottom of the rocky steep below it, by a much quicker route than the one we had taken in coming up. As it looked very sick, Kurbeer volunteered to clamber down and try to secure it. The danger of such a proceeding did not strike

"TO SAVE HIMSELF FROM FALLING, KURBEER WAS OBLIGED TO LET GO."

me until I nearly had cause to repent having allowed him to attempt it. Climbing cautiously below the ledge, he seized the little creature by one of its hind legs. In its struggles to free itself it toppled off the ledge, the lad still holding on to it with one hand, whilst with the other he gripped the ledge above him. At last, in order to save himself from falling, Kurbeer was obliged to let go, when the animal went whirling down among the crags. Had he lost his balance or his footing in the struggle . . . I don't like recalling the feelings of those few anxious moments to my memory.

Rather would I describe my sensations during a somewhat similar episode, when, from being the principal actor myself, they were less poignant than when beholding another in imminent jeopardy without the possibility of helping him, and for which I felt myself to blame. I had wounded a goral, and it had betaken itself to a steep bare slope, off which the dry grass had been recently burnt, where it lay down in a dying state on a shelving slab of rock. Not wishing to disturb the ground by unnecessarily firing another shot, I proceeded to secure the animal if possible by creeping up behind it, and laying hold of one of its hind legs, which I could see was hanging helplessly over the edge of the rock. No sooner did the animal feel itself seized than it kicked itself off the rock with the other hind leg, and fell struggling on to the steep slope below it. I still held on to its legs as we both went sliding head-foremost down the slope. But finding the pace was getting too fast to be pleasant, I let go. Fortunately I soon managed to stop myself by turning flat on my face, and stretching out my arms and legs like a spread-eagle, just as I was unconsciously nearing the brink of a nearly perpendicular drop. Over this the goral went headlong in company with my cap, which had fallen from my head in the struggle. It was afterwards recovered with the goral, which was found dead at the bottom. I felt truly thankful at having

escaped with nothing worse than my knuckles well barked and my clothes a bit torn by the sharp stones on the slope. But we must now try to recover our musk-deer.

The shikaree at once set off down the hill to look for it. And judging from the time we had taken in coming up, I concluded he would be a good while getting down and returning with it on his back; so I sat down and lit my pipe, Kurbeer doing likewise with one he had made by twisting a green leaf into a conical shape, which he filled with my cavendish, and smoked through his clasped hands by way of mouth-piece. The hill-men are decidedly ingenious in some of their extempore contrivances for smoking tobacco. The most primitive I have seen was a small hole made horizontally under the surface of the ground and left open at the extremities. At one end was placed the tobacco, whilst at the other each man in turn knelt down and inhaled two or three long-drawn whiffs of smoke into his lungs.

Waiting so long on the ridge was by no means irksome to me, for I was glad of the rest it afforded. Moreover, when situated on such an elevated spot, commanding so extensive an area of grand mountain scenery, one need never tire of watching the ever-varying effects of light and shade as some passing cloud floats lazily across the deep-blue firmament, temporarily darkening and seemingly altering the rugged features of the mountains beneath it. Sometimes a great bearded vulture (the Lammergeier of Europe) would come slowly soaring round the wall-like face of a cliff, rising high away to our left, and, with outstretched wings, sweep past so close to us that we could hear the rustle of his pinions. We almost fancied we could see his inquisitive eye regarding our prostrate forms with a hungry, sinister expression, as we lay motionless on the ridge. There was interesting enjoyment, too, in observing, through the spy-glass, the movements of a distant herd of tahr; and charms for the ear in the faint murmur of rushing water

far away in the depths of the valley below, and the wild whistling of moonals among the crags.

However, after waiting there for nearly two hours, we began to grow anxious lest some mishap might have befallen the shikaree. Mist, too, had been gradually gathering around the mountain-tops, the sky became rapidly overcast with dark driving clouds of a leaden hue, and the keen cold wind that accompanied them seemed to indicate an approaching snowstorm. At last, to our relief, the shikaree reappeared, and over his back was slung the musk-deer. Its skin was much torn and its bones were all broken from having been dashed from rock to rock in its fall.

The musk-deer (*Moschus moschiferus* of natural history), or *kustoora*, as it is here called, is a very delicately formed little creature, both in body and limb. It stands, at most, two feet at the shoulder, which is slightly lower than the croup. Its hind legs are very long, and are thus well adapted for the agile bounds it is so capable of making amongst the rocks, and have the appearance of being bent under its body, as though always ready for a spring. The ears are roundish, erect, and set closely together. In colour it is a dark-greyish brown, which deepens on the quarters, and is slightly mottled on the sides with spots of a pale brown. Its *pelage* is thick, springy, and brittle, each hair having a crimped appearance about half-way along from its root. The hoofs are small and pointed, and the upper or false hoofs peculiarly long. The habit of this little animal of returning to the same spot to deposit its droppings, is curious; they are frequently met with in heaps, which must have taken months to accumulate. Some of these heaps are highly scented with musk, while others are quite inodorous, which leads one to suppose that each heap has been made by the same individual. This deer carries no horns; but the upper jaw of the male is provided with a pair of canine teeth, which grow to a length of quite two inches, if not more. As the buck only has these teeth, it is hard to say

for what use they are intended, unless it be for fighting; but their rather loose setting in the jaw, and their fragile make, are against this theory. The does are so similar to the bucks in size and colour, that at a short distance it is almost impossible to distinguish any difference between them; consequently many of the former are destroyed unnecessarily. The musk is found in the male only, in a small bag under the skin, close to the prepuce. When fresh, the secretion is soft and moist, and of a brownish colour. Its smell is then rather offensive; but when it hardens and dries, the well-known odour of musk becomes so powerful as to be almost permanently transmitted to anything with which it comes in contact. On being taken from the dead animal, it is at once tied up tightly in a bit of the hairy skin that covers the gland, and is then called a "musk-pod." The musk-deer inhabits the high cold regions below the snow-line, where it generally affects thick rocky cover; but it is not unfrequently met with among bare crags, and occasionally about the highest tops of the middle ranges. The natives say it can travel over even worse ground than the tahr. Its cry of alarm is a kind of hiss. As musk is the principle ingredient used throughout the civilised world in the manufacture of most perfumes, a good musk-pod sells for sixteen rupees, or more. These little animals are therefore more sought after than any other game by the natives, who capture them mostly by snaring, in the following manner: A low fence is made of boughs, &c., along the ridge of a hill, sometimes a mile or more in length. At intervals of 100 or 150 yards are gaps. The musk-deer, crossing the ridge from one valley to another, come across this fence, and to save themselves the trouble of jumping over it, walk alongside until, seeing a little gap, they try to go through it. But in each gap a noose of strong string is placed on the ground, and tied to a stout sapling, bent downwards. The noose is so arranged that, when the deer tread inside it, the sapling is loosed and flies back, leaving

the noose tied tightly round the animal's leg. The people visit these fences every two or three days, and secure the deer thus caught, and repair the fences and nooses, which are often carried away or destroyed by larger game.

The musk-deer I had shot was unfortunately a doe. Although not so good as a specimen, it was better for the pot than a buck, the flesh of which is apt to be tainted with the flavour of musk.

Snow now began falling in feathery flakes as we struck down into the dark forest of tall and straight black-looking conifers that almost invariably clothe the northern exposures of the higher ranges on the south side of the great snowy chain. Here the ground was thickly covered with old snow, in which the tracks of jurrow were numerous; but as the day was now growing old, and we had still a long way to go, there was no time to search for the animals that made them. It was tiresome work plodding through the snow, which in many places was knee-deep, until, lower down, we got clear of it. As we descended, the falling snow changed to sleet, and eventually to heavy rain. Although the rest of the way was comparatively easy travelling, darkness was setting in ere we reached our camp.

We had now descended again to the continuation of the beaten track used by the Tartar traders, which up here follows the course of the Kallee (or the Sarda, as it is also called) for a considerable distance farther up the deep tortuous valley through which that big impetuous river flows, forming the boundary-line between British and Nepalese territory.

Starting at daybreak, we followed the regular mountain-road for a few miles, until we reached a small village, built on a slope, near the foot of a spur of the Chipla, rising from the Kallee. Here I breakfasted, made arrangements for replenishing our stock of supplies, and engaged fresh local guides and coolies for carrying the traps, preparatory to once

more encountering the difficulties of the craggy heights of the Chipla, after tahr.

Farther up the valley of the Kallee, on the open grassy slopes just below the perpetual snow-line, are good grounds for "burrel" (*Ovis nahura*). But I shall leave these wild sheep and their haunts alone for the present, as we are now after wild goats.

CHAPTER VII.

ALTHOUGH the Chipla, as seen from a distance, appears to be a huge solid spur abutting from the snowy wall behind it, on a nearer acquaintance it is found to have, as may already have been inferred, mighty spurs of its own, with noble rocky amphitheatres and stupendous V-shaped valleys lying between them. As you ascend these steep-sloping valleys they gradually grow narrower, and their sides become more precipitous until they reach the snow-fields on the heights towering above them.

Up one of these steep spurs our way now led. To the left, as we ascended, its southern face fell away abruptly, either in a succession of irregular drops, like huge steps, or in rocky rifts and gullies. As we mounted higher, these features were exaggerated until they became broad and terribly steep inclines, appalling precipices, and almost vertical rocky gorges, terminating in landslips of rubble and *débris* running far away down into the contracted depths of the valley below. To the right, the northern exposure was rough and rocky, and, as usual, clad with primeval forest.

We went ahead of the coolies up a kind of goat-track for a mile or two, when our village shikaree suggested that we might take a turn over the steep broken ground on our left, and look for gooral, which, he said, were likely to be found there. We had not to search long before one was started.

"Shoot quick! or he'll be away out of sight down the rocks," excitedly whispered the shikaree, as the animal he

had suddenly detected, after going a short distance, stood for a few moments to gaze back at us. Although hurried snap-shots in mountain-hunting are, as a rule, a mistake—for it is better to let an animal go free on the chance of getting another and better opportunity, than to risk missing and disturbing the ground by firing an unsteady shot—yet this one luckily told. The goral which fell to it was fortunately stopped by some projecting rocks ere he had rolled down very far, which saved us much trouble in fetching him.

Rain, which for some time had been threatening, now began to fall. This made the steep slopes slippery and dangerous; we therefore thought it prudent to get back on to the ridge, where we soon overtook the coolies toiling up the winding track with their loads. Leaving the dead goral in their charge, we again went ahead.

We were now nearing ground where, at any moment, we might chance upon tahr. For the wild animals in these high regions are very irregular in their feeding-times, and may be seen out browsing at all hours of the day, and more particularly in wet or cloudy weather, when there is no need for them to lie up for shelter from the heat of the noonday sun.

Some distance higher up on the spur we came to a kind of promontory that sloped down from it, and extended for some distance along the side of a rocky hollow scooped out of the steep mountain-side. In order to examine the precipitous depths of the hollow, into which we could not see from above, we crept cautiously down behind the promontory. As the shikaree, who was in front, slowly raised his head to look over, he suddenly drew back and whispered "tahr." On the opposite face of the hollow, and slightly below us, not only were there five or six tahr on a narrow and steeply sloping terrace of short green grass that ran obliquely downwards across it, but there was also a small herd of goral browsing unconcernedly not far from them,

and both were within range for a longish shot. Singling out the tahr that looked the best, I waited until he was in a good position for taking him. As the report of the rifle rang out, his companions instantly made off, and scaling the impassable-looking rocks above them with the most marvellous agility, disappeared over the ridge on the opposite side of the hollow, without stopping to give a second chance. The one I had shot at seemed so badly hit, as he went hobbling away after them, that, feeling sure of eventually getting him, I at once turned my attention to the gooral. They looked very much perplexed, but did not move off until I had emptied my second barrel at one of them as he stood hissing out his note of alarm.

"He's hit too!" exclaimed the shikaree with great glee, as the animal contrived with difficulty to follow the rest of the herd over the ridge, some distance lower down than where the tahr had crossed it. Scrambling down the side of the promontory, we almost ran along the sloping terrace the animals had been on. In cold blood I should most probably have hesitated to cross it at all, for the incline was so sharp that a slip would have been fatal, and it was not until we were on it that I could see the profound depth of the abyss below.

The shikaree now climbed after the tahr, whilst Kurbeer and I took up the track of the wounded gooral. The ground, which would at any time have been bad, was now rendered frightfully dangerous by being very wet and slippery from the rain which was still falling. We had missed the track of the gooral, and I was carefully going along the brink of a craggy precipice, to which I thought the wounded animal might have betaken himself, with my gun ready to finish him with a buckshot-cartridge, should I catch sight of him among the rocky ledges below. Kurbeer was some distance higher up, on a very steep incline of short grass rising immediately above me, searching for the lost track. Suddenly I heard a scuffling sound above.

Looking upwards, to my horror I saw that the lad had lost his footing on the slippery wet earth, and was rolling and sliding down the slope, clutching frantically at the short grass with his free hand, for, notwithstanding his danger, he still kept hold of my rifle he was carrying with the other. At once I saw that his only chance lay in my being able to arrest his progress before he reached the brink of the precipice. I had scarce time to deposit the gun safely on the steep ground, in order to have both hands free, ere he was down within a few yards of me. Fortunately I happened to be almost directly below him, so I set my teeth, dug my feet as firmly as possible into the wet earth, and, holding my breath, stood ready to try and stop him, for I knew his life depended on my being able to do so. Another roll and he would have been over. Making a desperate clutch at him, I luckily got firm hold of his loose clothes, thereby checking his descent sufficiently to enable him to recover his footing, otherwise his weight and impetus must have taken us down together. All this, of course, happened in very much less time than I have taken to tell it; and my mingled feelings of horror and thankfulness at this narrow escape were such as to be not easily forgotten.

We now called a short halt to recover the tone of our nerves, which had naturally been rather shaken by what had occurred. But as any one who hunts properly over such mountains as these is often more or less exposed to dangers of this kind, it is best to keep the mind as much as possible from dwelling on them. We therefore were not long in resuming our search for the wounded goral, and we shortly after came up with him where he had lain down, when I secured him with a shot-cartridge.

The shikaree soon rejoined us after having tracked the tahr into ground where it was impossible for him to follow farther. It was now getting late in the day, and we had still some very difficult ground to get over, so, the goral being shouldered by the shikaree, we made the best of our

way to the place where he had directed the coolies to make for. This was, as hitherto, a kind of open cave formed by the big rocks that overhung it. We reached this welcome haven just before dark, weary and wet through. The coolies had arrived some time before us, and there was a savoury odour arising from the cooking quarter, which was most grateful to us, tired and hungry as we were.

In the Himalayas, at this time of year, the atmosphere is often dim with a bluish gauzy haze, which gives the mountains, and especially the more distant ones, a beautifully soft and dreamy appearance. This effect is probably due to the air being permeated with thin smoke, caused by the old dry grass on the mountain-slopes being, at this season, so much fired by the villagers, in order that the young green blades afterwards springing up on the burnt ground may the sooner afford fresh pasturage for their herds. I have seen the same effect produced by the smoke from the forest-fires in the Rocky Mountains and the backwoods of Canada during "the fall," when a sudden change of wind will dispel it in an hour or two, and make the atmosphere as clear as ever.

Next morning we had not gone much over half a mile from our cave when we descried some dark objects moving among the rocks away down below.

"They are bucks for certain, as they look so black," so say Kurbeer and the shikaree, as I proceed to adjust the telescope, using my iron-shod staff as a rest for it; and bucks they prove to be. Three or four only are visible, but others may be hidden by the rocks. If they remain where they are, we can pretty easily approach them unseen, though it will be more difficult to do so unheard. For when stalking animals from above on precipitous ground, be it ever so favourable as regards cover, there always remains the probability of detaching loose stones, and of making more noise in clambering downwards than upwards.

As my two companions, with bare feet, generally precede

me in our down-hill stalk, they contrive to cleverly "field" the stones set in motion by my heavy nailed boots, and sometimes place a hand or a shoulder against a smooth rock, or drive the point of an alpenstock into the ground for a footstep below me, until at last we manage to get within easy range. The shot is a downward one; so aiming low, I let the best-looking buck have it. Off they all start, but the one shot at soon separates from the herd, and makes for the brink of a declivity just below. As he nears it he stumbles and totters, struggles to the edge, and toppling over it, disappears from our sight. Meantime the rest have stopped to look back, giving me a chance at another fellow with the second barrel, ere they take their final departure.

On our reaching the spot where the tahr had gone over, we find beyond a sheer drop of fully a thousand feet. As we crane our necks forward to look down, we can see what we suppose is the dead animal lying among a confused mass of broken rock and boulders beside the torrent at the narrow bottom of the valley, but from the colour being so similar to that of its surroundings, the aid of the telescope is necessary to make certain. There lies our tahr, but how to fetch him is now the question. As reaching him is impossible, unless by making a long round which would occupy many hours, we finally decide on leaving him for the present where he is, and straightway proceed to follow up the other buck I had shot at, and soon find plenty of blood on his track.

In the excitement of our stalk we had failed to notice that a scudding rack was fast overspreading the cloudless sky of the early morning. A heavy veil of mist, too, was now trailing itself up the valley, and rain soon began to fall. The traces of the wounded tahr were rapidly becoming obliterated by the fast-falling drops; and as the track lay over very bad ground, our experience of the day before made us rather chary of following farther in the wet, so we gave up the pursuit. The mist also had become so dense

that we could hardly see a dozen yards around us, making it difficult even for our guide to find his way back to the cave, towards which we now turned our steps.

On the morrow the early morning again broke bright and clear, so our shikaree proposed that we should bivouac, for the night, higher up on the hill, where, after pointing out the dead tahr to the men who were to fetch it, he was to rejoin us in the evening. As the way was rough and steep for laden men, and we might up there in some places find the snow lying deep, he recommended our taking only our blankets and ready-cooked food with us. It was late in the morning when Kurbeer and I started with one or two of the men who knew the way, to our quarters for the night. We had not proceeded far when one of those sudden changes, so common in the mountains, came over the smiling face of nature. The hitherto sunny sky became obscured with clouds, and our inveterate enemy the rain was soon falling heavily on us. We toiled upward, nevertheless, until we reached our destination, another cavity among the rocks. Here we made a big fire, for which we fortunately found plenty of wood at hand. At this we dried our wet clothes and blankets, and made ourselves as comfortable as we could under the circumstances for the night. The shikaree turned up before dark, and reported that the tahr had been recovered, but that one of its horns had been broken off at the root in its fall, and was nowhere to be found. This was a pity; but we were lucky in having got the animal at all, for the shikaree said the place above where it had fallen was such a tremendous "pakhān" (precipice) that it was as much as they could do to reach where it lay and get back with its spoils.

Having gone up so far, we thought we might as well continue our ascent to the ridge above, and prospect the country beyond it for game—as, being above the timber line, the northern exposure would at that elevation be as bare of forest as a southern one usually is at any height.

Before we could reach the ridge, however, it was necessary to traverse an exceedingly awkward place. It was a very smooth slope at a fearfully sharp angle. Not the smallest excrescence was there on it for foothold. The ground was covered with a thin layer of fresh-fallen snow, just enough to make the footing slippery and treacherous. Below it the rocks fell away so precipitously that the consequences of a false step would have been too dreadful to contemplate. There were only some fifty yards of danger, but my nerves underwent a considerable amount of wear and tear before we got over them. Be it remembered, this was my first essay at hunting on the upper ranges. Hitherto I had thought something of my experiences on the gooral grounds of the middle ranges, until they were totally eclipsed by those of the vast heights of these upper regions; and such a place as we had now to negotiate might certainly have been considered, to say the least of it, unpleasant, even by the boldest and most experienced of cragsmen.

It is on these dangerous slopes where that trusty companion of the mountain hunter, the iron-shod pole, affords such invaluable assistance, both as a support and for digging notches for foothold in the hard ground or frozen snow. It will be found more serviceable for the latter purpose if, instead of the usual iron point, it is shod with a light triangularly-shaped spud, having its lower edge about an inch and a half broad. It is almost needless to suggest that one of the party should always be provided with an axe of some sort, and the common little "kool-harree" (wood-hatchet) which almost every hill villager, when out on the mountain, carries in his girdle—usually a coil of rope to be used in case of need—answers all hunting requirements, as well as the best of ice-axes. The sensation termed "giddiness" I have never, in the literal acceptation of the word, experienced when on dangerous ground; but I freely confess having felt what is vulgarly

called "funk." Perhaps, in this case, the terms are synonymous. From constant practice, however, in mountain-climbing, one grows more confident in his feet, and more callous in his nerves. But I have dwelt so long on the danger of the mountain-slope, and the ideas suggested by it, that, at this rate, we shall never reach the ridge.

At last we arrived at the crest, and found, as we expected, that the northern slopes were, at this height, almost free of wood, except some scattered birches, rhododendron-bushes, and broad patches of juniper; but the ground was in many places covered with snow-fields. Soon, however, our view of it became obscured by blinding snowflakes that now began whirling about us, so we struck down the ridge, which trended towards our old quarters. There was still a chance of starting a musk-deer from among the birch and rhododendron bushes, for their fresh tracks were numerous, but these were soon obliterated by the falling snow, and not an animal did we see.

Floundering down through the deep snow-beds was tiresome enough, but as descending the spur was much quicker and less laborious work than ascending it, we reached the lower cave much sooner than I expected. On arrival we found most of its occupants in a complete state of prostration, and suffering severely from the effects of having partaken too freely of tahr-meat. The sky had cleared again, it was still early in the afternoon, and being my last day on the hill, after refreshing the inner man we once more set out.

We had made for the ground below, in the direction of the place where we had lost the first tahr I had shot at in this vicinity. Kurbeer was following me, carrying my rifle, when suddenly I heard him hurriedly whisper, "There he goes! and he's surely the tahr you wounded, for he's lame," as a big buck jumped up from behind some rocks close to us, and rattled off. Had I had the rifle in my hand I could have got an easy running shot; and when I

did lay hold of it, I waited, thinking the beast would be certain to stand and gaze back. But he had no intention of stopping, so I lost my chance. *Nota bene*—always have your rifle in your own hands on likely ground when you can, for many an easy chance is thus lost by letting it be carried for you. We did not follow far, for even had the tahr been our wounded one, there was now no blood on his track. On our way back we saw a herd in the distance, but the shadows were already deepening around, rendering a long stalk impracticable.

We now commenced retracing our steps homewards. For several days our route lay along the valley of the Kallee. The roaring river surging along between steep forest-clad or rocky acclivities made the scenery wild and grand, but one's appreciation of its charms was considerably marred by the concentrated heat at that season in this low-lying narrow valley, and by the inclemency of the weather. A halt was made at a place said to be famous for jurrow and kakur. Had I then known that near this place there was a famous salt-lick close to the river, I might, had I cared to take advantage of it, have spared myself the trouble of perspiring over the baked hillsides of these low warm regions in quest of game.

These salt-licks, or *kar* as they are termed by the natives, which may be described as places where the ground is strongly impregnated with some sort of saline or alkaline matter, are here and there met with all over the mountains. In such spots large cavities may often be seen where the earth has been scooped out of the hillside by the animals partaking of the *kar*. In wild unfrequented parts where game abounds, I am told that animals can at times be actually slaughtered by watching these licks.

One day we came across an encampment of Tibetan Lāmās¹ in their black blanket-tents. They were returning to their

¹ The sacerdotal class of Tibetan Buddhists are called Lāmās, many of whom are engaged as much in their temporal as in their monastic pursuits.

homes in "Hundés," as that part of Tibet lying beyond the mountain-passes of the Gurhwal and Kumaon provinces is called. A wild, queer-looking lot these Tartars were, with their flat, ugly, but good-humoured countenances, small eyes, pig-tails, and peculiar dress. The latter generally consisted of a loose garment of coarse woollen stuff of a dirty purplish hue, confined at the waist by a girdle of cloth or a belt. In this was stuck a tobacco-pipe, about 8 or 10 inches long, with a very small brass bowl, and mouthpiece of the same material. Depending from it was also a "chuckmuck." This useful appendage—which, together with the pipe, and a wool-spindle, these people are never without—is a steel attached to a small leathern pocket containing a flint and tinder. It

Tibetan "Chuckmuck," for striking a light.

is often ornamented with red cloth covered with open work of silver or brass, and fastened to the girdle by a leather thong or metal chain. The rest of their apparel consisted of long woollen boots, fastened below the knee, and soled with raw hide; and a small cap either of felt or woollen cloth, sometimes with fur-lined lappets for covering the ears. Some of these people were rather profusely adorned with rude

ornaments, principally consisting of silver amulets, strings of large coral or other beads, and large lumps of rough amber and turquoise, either real or sham, worn round the neck.

The occupation of both sexes appeared to be spinning wool with their spindles, which, whether sitting or strolling, they kept perpetually twirling, even when tending their large droves of sheep and goats. These animals they use as beasts of burden, each carrying down from Tibet its little load of borax or salt in a small pair of bags, and returning with them refilled with rice or other grain. The heavier articles are carried on stout ponies, or on yaks—the bovine cattle of Tibet.

The women had very much the same dress and general appearance as the men, excepting a long narrow flap of cloth, extending from the top of the head down the back to below the waist, and ornamented with bits of amber, turquoise, coral, and cowry-shells. They were strongly built like the men, but, as a rule, not a whit less plain in feature. The exceptions were two or three sturdy young girls, whose rosy cheeks and merry expressions gave their faces a pleasing look, which in a great measure compensated for their lack of real beauty.

Whilst mentioning the flocks, their canine guardians should not be forgotten. Two or three of the fine large dogs, known as Tibetan mastiffs, invariably follow the camp of these nomads. They are most excellent watch-dogs, and never seem to rest during the night, when, much to the annoyance of the weary traveller who may chance to encamp near, their deep-toned bark is incessantly heard. As some of these dogs are both bold and savage, a man or even a beast of prey would be rash in approaching a Tartar camp after dark; and, when protected by the strong iron-spiked collar they usually wear, they are quite fit to cope even with a marauding leopard.

Notwithstanding the comparative smallness of the bag, my first trip to "the snows" had been most enjoyable; and to the true lover of wild sport, who is always an ardent

admirer of nature as well, the mere slaying of his game is certainly not what conduces most to his delight in his work. For my own part, a feeling of regret has always been mingled with my exultation, at seeing a beautiful animal I have brought down lying lifeless before me, however inconsistent it may seem. Nevertheless, it is very satisfactory to make a good bag. When I say a *good* bag, I mean one of fine, and, if possible, of varied specimens, and not made up, merely for the sake of competition, of inferior animals, such as a man of true sporting instincts would feel ashamed to shoot at, unless he required meat for his camp. I have less sympathy with those who shoot only for the bag, than with the downright old poacher; not the murderous, skulking cadger of the present, who nets and snares for the game-dealer, but a man of the bygone Highland stamp, who stalked a fat stag or shot a brace of grouse quite as much for the keen excitement of the sport as for providing venison for his family and his friends.

Spring is certainly not the best time of year for tahr-shooting. The proper months are October and November, when the old bucks have their shaggy hair much darker and longer, and the toil in searching for them is lessened by their being at that season lower down on the mountains, and associated with the does. The weather, too, is then sure to be settled and fine, which, of course, adds so much to the pleasure of hunting. In fact, "the fall" is the best season for sport of almost every kind in the Himalayas, as it is elsewhere.

CHAPTER VIII.

“ WHO has not heard of the Vale of Cashmere ? ” Soon it may almost be said, Who has not seen it ? for it is now becoming a regular resort of the tourist.

My first visit to the “ happy valley ” was during the reign of the Maharajah Gholāb Sing, to whom it had but recently been disposed of by the Indian Government, and it had then been only a few years “ open to the public.”

All arrangements in the way of travelling equipment, &c., for our trip having been completed, I started from Rawul Pindi in April, with a young brother-officer, who, like myself, was an ardent lover of wild sport. My left arm had but a short time been freed from the bondage necessitated by a broken collar-bone, which I, however, hoped would be quite fit again ere I commenced rough mountain-climbing. There was little to interest us along the first part of our route, so we got over it as quickly as possible, our object being to reach our shooting-ground in the beginning of May, which is generally considered the best spring month for ibex-hunting. Earlier in the year, and particularly if it be a late one as regards snow, this sport is attended with considerable risk from the constant falling of avalanches ; and the mountain-passes leading into the best ibex country are then difficult to cross, and sometimes not practicable before May. Later in the season, when the mountains are more free of snow, the ibex are higher up and more scattered on them, and consequently more difficult to find.

Every traveller by the Murree route to Cashmere must be as much struck as we were with the romantic beauty of that part of it between Uri and Baramoola, where, for the last eighteen miles or so before reaching the valley, the path winds through shady woods of deodar cedars, horse-chestnuts, and other grand forest-trees, or thickets of hawthorn and wild-rose bushes, where steep sloping acclivities and craggy pine-clad heights flank it on the right, whilst on the left the river Jhelum rushes by with a deafening roar, which resounds among the mountains rising lofty, and often snow-capped, on either side of the contracted and winding valley through which that splendid river here flows. The tremendous volume of water tears and surges along, in some places taking the form of a raging cataract, in others churning itself into broad sheets of seething foam. The Cashmeres have it that the beautiful Jhelum gives vent to these mad caprices by way of showing her wrath at being forced to quit their lovely valley, through which she flows so tranquilly. And should the wayfarer have an archæological bent, he can here find, half hidden among trees, and much overgrown by their gnarled old roots, some curious ruins—so ancient as to be of doubtful origin—to interest him as he rests by the roadside.

Nor can any one with an eye for the beautiful look unmoved on the charming scene that suddenly presents itself as he reaches the brow of the hill, whence the road slopes gently down to the pretty village of Baramoola.¹ How changed is the river Jhelum—now looking smooth and bright as burnished metal—where, as it winds tortuously over the green expanse lying below, it resembles a huge silver serpent issuing from the Woolar lake lying dark and blue along the base of the distant snow-crested mountains, among which square-topped Haramook towers like a hoary old giant above his smaller dependants! And the numerous hamlets that are dotted over the verdant plain, what pleas-

¹ Since then earthquakes have, I am told, made sad havoc with this place.

ing features of the landscape they present, as they lie embowered among groves of walnut and poplar trees, and grand old chenars (oriental plane)! which latter, with their pale-grey trunks, and summer foliage of brilliant green, constitute one of the principal ornaments of the Cashmere valley.

Before us, at last, lay the far-famed "Vale of Cashmere." There was music in the very name, which to our youthful minds conveyed ideas of the "nightingale's hymn," "love-lighted eyes," and everything enchanting. And, truly, nowhere could a spot have been more aptly chosen for a poetic romance than the scene of "the feast of roses." There is, however, a dark side to the picture of this lovely vale; for the fearful epidemics, famines, fires, and earthquakes with which, during my own recollection, it has so often been visited, and in some instances partially devastated, tend to show that it is not always a "valley of bliss." But I am wasting time in thus descanting on the charms and woes of a country that is now so well known.

We did not give ourselves up very long to romantic ideas about the vale, as our thoughts were just then centred more in the ibex on its neighbouring mountains—so, having hired two of the picturesque-looking boats of the country at Baramoola, we at once started up the river, and reached Srinuggur next evening. At this quaint old wooden metropolis we made a short stay to complete a few final arrangements, and to engage shikarees before proceeding to Wurdwan—a wild, remote district eastward of the valley. The Wurdwan mountains, which are now so well known to sportsmen, were generally considered the best ground for ibex. Early in the spring, whilst the winter snows still lay low down, ibex might, at the time I write of, have been found on the hills rising immediately above, and north of the Cashmere valley; but the old bucks receded with the melting snows to higher and more distant solitudes.

With regard to engaging shikarees at the capital, subse-

quent experience taught me what a mistake I had made in doing so, as those worthy of the name seldom come there to seek employment, but remain at their homes, which are generally near the hunting-grounds, until sent for. But as the country and its language were then new to us, we were obliged to at once engage men as guides and interpreters.

And now a word regarding Cashmere shikarees in general, for I have no doubt most of them are no better at present than they were then. With few exceptions, even the best of them are an avaricious grasping set of men, who are never contented,—in fact, the more you give them the more they want. But the arch-scoundrels are the fellows that pester the new arrival at Srinuggur with numerous testimonials they may have received from tourists or others who have managed to slay a few black bears under their guidance, which animals any ordinary villager might have shown them where to find. These pseudo-shikarees are usually “made up” in sporting costume, wearing *puttees* (woollen bandages) round their legs, *poolas* (straw sandals) on their feet, and belts covered with leathern pouches, hunting-knives, &c., round their waists. They are, or were, as a rule, the most unmitigated impostors in Cashmere, generally giving themselves all sorts of fine airs, and expecting the most exorbitant wages, besides food and presents of cash. In addition to this, they frequently use their employer’s name for obtaining anything they require from the villagers, for which they usually forget to pay. The real good men, of whom there are comparatively few, are only to be got by making arrangements with them beforehand, either by messenger or letter. As such men are, of course, in great request, obtaining their services is not always easy. Should the sportsman, however, fail to get a well-known good shikaree, it is better for him to proceed to his ground without one of any sort, and trust to picking up a non-professional hand at some village in its vicinity, than to engage one of the aforesaid impostors, who, in any case, would get

what guidance and information he wanted from a villager, whilst he, the impostor, pocketed the profits. Although these remarks may not be very entertaining, they may be useful to a sportsman visiting Cashmere for the first time.

Of course we were soon surrounded by these rascals wanting service, and as at that time we knew no better, engaged two. My companion was more lucky in his choice than I was in mine, as his man turned out to be a great acquisition; the one I engaged proved the very reverse. Again taking to our boats, we continued our course up the river to Islamabad.

For some distance above Srinuggur the windings of the Jhelum are so tortuous as to form a succession of pear-shaped loops, so to speak, of water. There is a legend in Cashmere that the idea of the loop-like pattern, so common in Cashmere shawls, was originally suggested by the appearance of the river thus winding through the valley, as viewed from the top of an eminence near the city, on which stands the ancient temple called Takht-i-Suliman (Solomon's throne).

Islamabad we reached next day, and after inspecting its tanks, teeming with sacred fish, and collecting men to carry our traps, at once went on to the village of Shangus, about eight miles distant. At this place we purchased a supply of rice for our followers, as we were told that food for them would not be procurable in Wurdwan. Here also I was lucky enough to secure the services of a well-known shikaree. This man's demeanour was totally different from that of the sham one I had had the misfortune to already engage. Ramzan Meer was a grave, taciturn, little old fellow, very much addicted to snuff, and was not, at first sight, either in appearance or costume, the sort of person one would have taken for the first-rate hunter he really was. He was dressed in the loose wide-sleeved garment of light woollen cloth commonly worn by Cashmerees, which reached almost to his feet. His waist was girt with a white *kum-*

merband (sash), without so much as the knife, invariably carried by Mohammedans, visible, and his head was loosely wrapped round with a huge white and very clean turban. But there was something about his eyes which spoke volumes. The Srinuggur man was, on the contrary, a noisy hulking fellow, got up in the conventional impostor style, with belt bristling with sporting appurtenances, and who was continually boasting of his exploits with his former employer, and what he now intended to perform with his present one. Nor was Ramzan, though a good man and true in many respects, quite "straight" where his own interests were concerned, for I learnt from a brother sportsman I afterwards met in Wurdwan, that he (Ramzan) had a prior engagement with him, by letter; but thinking, I suppose, that "a bird in hand is worth two in the bush," he had taken service with me. I owe it in gratitude to this *true* sportsman (an officer then belonging to the 27th Foot), to record that, on my hearing the facts of the case, and offering to give the man up, he generously refused to deprive me of his valuable services. And here, as a sample of the dangers which sometimes attend mountain hunting, I may also chronicle a narrow escape that this same sportsman told me of his having made shortly before I met him. He and his men were after a herd of ibex, and had but just crossed a steep gully, when a tremendous avalanche of rocks and stones thundered down it. Not many yards ahead was another gully they would have to cross, but ere they had recovered from their astonishment, to their dismay a similar avalanche rattled down it also. Most probably both had been the result of a landslide far above, which had, in some providential manner, been diverted to either side of them in its descent, or they must have been swept down by it.

Our next day's tramp was at first across a low range covered with wood, and then up the valley of Nouboog, to a little hamlet consisting of a few log-built huts, much resembling the ruder kind of Swiss *chalets*. The scenery of

this long narrow "strath," as it would have been called in Scotland, or "nye," as it is here termed, is surpassingly lovely. Flanked on either side by high hills, on which broad tracts of deodar cedars and tall sombre-hued pines alternate with rocky steeps or green sloping glades, it extends up towards the Mergun pass into Wurdwan. Mulberry-trees, weeping and pollard willows,¹ overhang the clear brawling stream that meanders through it, between banks of velvet-like turf. Here and there along the base of the mountains, picturesque groups of log-built houses lie nestling among groves of grand old walnut and chenar trees. Early in summer an additional charm is lent to the beauty of this glen by the ground being carpeted with both red and white clover, and by the wild indigo plant, which grows there in great profusion, being in flower, its purple blossom looking, at a distance, like luxuriant blooming heather.

Shortly after starting next morning, as we neared the head of the Nye our surroundings assumed a much wilder character, and the path became more and more steep. The latter now led close beside the stream, which up here took the form of a rushing torrent as it dashed over rocks and fallen pine-trunks that lay in and across it in the wildest confusion. After pitching our little tents on a small grassy flat a short distance below the pass, there being still several hours of daylight left, we took our rifles and sallied forth, each in a different direction, with our shikarees, on the chance of getting a shot at a deer or a brown bear, either of which animals Ramzan said might here be met with.

Judging from the fresh tracks, hangul must have been pretty numerous, although we saw none. And even had we found a stag, he would most probably have been hornless, as these deer have generally shed their horns by the end of April. As for brown bears, I had ocular proof of

¹ Willow-trees, which grow abundantly in the Cashmere valley, are generally cut down into pollards, the young shoots being stored and used as winter fodder for cattle.

their being plentiful there, for I saw five. First we espied three together, but they had unfortunately got our wind, and were in full retreat. Just as it was getting dark we saw two others eating the green grass on an open space at the bottom of a gully flanked with birches. By the time we got near them, the light was so bad that I was unable to see the fore-sight of the rifle; but the loud response made by one of them to my shot, showed that it had told. The beast, however, made off with its companion, and it was too dark to follow it up.

As the snow on the pass would be easier for our laden men to travel over when hard frozen in the early morning, we were off again at the first break of dawn. The ascent to the pass, though short and comparatively easy, was nevertheless pretty steep and rough. Silver birches now took the place of conifers, and still higher, tangled masses of juniper-bushes spread themselves widely over the open hillsides, which were craggy, broken, and here and there covered with patches of snow. On the pass, which is 12,000 feet high, where our track was almost level for some distance, the snow still lay very deep, and we often sank up to the knees in it. Several times we had to wade through a half-frozen stream, from the cold of which our legs were tolerably well protected by the *puttees* that were bound round them; but our feet, on which we wore only *poolas* over our stockings, suffered terribly. Fortunately the sky was overcast with clouds; for, on the higher ranges, if the eyes are not protected with a coloured veil or goggles, the sun's glare off the snow frequently causes temporary blindness, which sometimes lasts for several days.

We saw numbers of marmots, here called "drin," among the loose fragments of rock that had slipped from the flanking heights, and were piled together in confused heaps, off which the snow had partially melted. The creatures, on observing us, would sit up on their hind legs and utter their shrill, chirping cry, like a loud dog-whistle blown sharp and

short, which sounded quite eerie as it broke the frozen stillness around. They frequently let us approach within small-shot distance, but if not shot quite dead, they instantly dived down among the interstices of the rocks, from which it was impossible to get them out. These marmots are considerably larger than the Alpine ones. Their general colour is yellowish below, and reddish brown intermixed with black above.

After a long and steep descent, where we had, in some places, to keep a sharp look-out for detached rocks and stones rolling down from the heights above, in the evening we reached the village of Unshin, in Wurdwan. Here we learnt that four sportsmen had already crossed the pass, and had taken up their hunting localities, with which we were in honour bound not to interfere. As three of them had gone up the main valley northwards, and only one had gone down it, we decided to proceed in the latter direction.

The following day, after proceeding about six miles down the valley, I struck up a steep narrow glen to the left, whilst my companion went straight on with the intention of hunting over the mountains above Mārroo Wurdwan further eastward. A rough walk of several miles up the glen brought us to the spot where Ramzan proposed pitching our camp for the night. Next day was Sunday, and never can a day of rest be more appreciated than when hunting among such mountains as these.

On Monday morning, as we were proceeding up the glen by the side of the torrent that tumbled impetuously down it, Ramzan, pointing upwards, quietly remarked in a casual sort of way, "There are bears up yonder." He evidently considered bears—which were in those days so very numerous among these Cashmere mountains—to be almost beneath our notice when we were after ibex. There they were, however, two of them, feeding on a green grassy slope some distance above, and I had no idea of letting them off without a shot if I could help it, and more especially as I had not up to

that time killed a brown bear, or, as it is sometimes called, a snow-bear. Taking care to keep well to leeward, we easily got up to within a few yards of them; for although these bears, like all their tribe, have a marvellously acute sense of smell, their eyesight is comparatively defective—so much so, that when occupied feeding, one might almost approach them behind the cover of their own hairy bodies, if not to windward of them. The first shot was planted well behind the shoulder of the nearest beast, which went trundling head over heels down the hillside, until it fell into the torrent below, where we afterwards found it in a deep pool. Before the other fellow had recovered from his astonishment, the contents of my second barrel were into him. With a loud grunt he started off downwards, but before he had gone very far we could see that his race was nearly run, for he showed certain symptoms of approaching dissolution. I was the more satisfied at having shot these two beasts right and left, because, even if a lucky fluke, as it probably was, it impressed old Ramzan with the idea at the time, however erroneous it might afterwards prove, that his endeavour to show me ibex might not be quite fruitless, and he consequently would be more likely to take pains to find them.

The Himalayan brown bear (*Ursus isabellinus*) or “Kooncea Harpat,” as it is called in Cashmere, usually inhabits the cold regions of the higher ranges near the snow. But being omnivorous like the black bear (here called “Seeah Harpat”), it is often found as low down as the Cashmere valley, which is only 5000 ft., where it grows fat on fruit and grain, and even carrion, for which latter it has a great predilection, when it can find it. I once shot a big brown bear in the Cashmere valley while the beast was in the act of devouring the putrid remains of a dead cow. In spring, after waking up from its winter snooze, it carries little or no fat, its food then chiefly consisting of green grass, which may often be seen regularly cropped down by bears as if cattle had been grazing on it. The colour of

this bear is usually a yellowish or isabelline brown. In some cases the shade is very much darker than in others, and the long soft pile often has a silvery tinge on its extremities, but its colour and length vary very much with the seasons of the year. In the month of May the skin is in splendid order, but later on in the summer it is not worth the trouble of taking off. Although these bears often attain a large size, some of them measuring as much as 7 feet in length, and standing well over 3 feet at the shoulder, they are not as a rule very pugnacious, although a cantankerous customer may sometimes be met with. It is always unadvisable, however, to shoot at any kind of bear that may be directly above one on a hillside, for the first impulse of a bear on being hit is to rush or roll straight down-hill, and whether the beast means mischief or not, it is apt, in its flight, to claw anything it may come across. Bears used to be so common in the Cashmere mountains, and might be got with so little trouble, that, when after ibex or suchlike game, the sportsman seldom laid himself out much to shoot them.

We skinned the bear that had succumbed on the hill, and then descended to the stream. With some difficulty the other beast was extricated from his bath, and after a like operation had been performed on his wet coat, we went on to the place where we next intended to camp, farther up the glen.

The night came on stormy and boisterous, and next morning the surrounding heights were so coated with fresh-fallen snow as to make stalking almost impracticable. About noon, by which time the heat of the sun had melted most of it off, we went out, and soon sighted a herd of eight or nine ibex, but none of them were large old bucks. We tried an unsuccessful stalk over some abominably steep snow-beds, where it would have been difficult to travel without straw sandals, which give wonderfully firm footing on steep rocky ground or hard sloping snow. These sandals,

or *poolas*, as they are called, are made of thin rope of twisted rice-straw, and when that is not procurable, of grass, or twisted strips of thin wet bark. As they only stand at most one day's hard walking, a great many pairs are worn out; but the Cashmerees can make a pair in an hour or so.

For the next day or two the rain, snow, and thunderstorms were so incessant, and the mist clung so constantly to the mountain-sides, that hunting was impossible. We made an

A pair of Poolas.

attempt one morning to go up after ibex, but were soon beaten back by a blinding snowstorm. I wounded a bear that had wandered close to our camp, but lost him. To add to our troubles, I found that our stock of rice was getting exhausted, and a man I had sent down to fetch more from Mārroo, the nearest place where it was procurable, had returned without it.

A consultation was now held, when it was agreed that we should make for Mārroo, by a way known to Ramzan over the heights at the head of the glen we were in, hunting *en route*, and after having there replenished our stock of provisions, return to our ground. We accordingly moved the camp on somewhat nearer this pass, intending to cross it next morning.

Towards evening I started out for a stroll up the bottom of the glen in hopes of getting a shot at an old Bruin. We had not to go far ere we espied three in company, but they managed to wind us before we could get within half a mile

of them. Soon, however, we find another—a monster that looks like an ox as he grazes on a small grassy flat beside the stream that runs down the glen. He is in a good place for a stalk, and this time the wind is right. Under cover of some detached blocks of stone strewn here and there about the ground in his vicinity, we easily approach him within twenty yards or so. The first shot, which is aimed, as I imagine, well behind the shoulder, strikes, probably, too low, for it only sends him off with a loud angry *wugh*. The second, catching him in rear, has merely the effect of accelerating his flight and making him grunt again. Away he shambles across the stream, and then takes straight up a steep-sloping snow-field, dyeing it with blood, until presently he begins to show decided signs of distress. Without waiting to reload, as I should have done, Ramzan and I start in pursuit with the other rifle he is carrying. Under cover of a depression in the snow-bed, running up parallel to his course, we soon overhaul him, when I ply him with a third bullet. Loss of blood now begins to tell, for this time he only makes a whining remonstrance, and after moving on a few paces again pulls up. The contents of the remaining barrel elicit another testy reply, as he slowly turns round and stands glowering about him in a manner that seems to bode mischief. Luckily for us, he has as yet neither seen nor got wind of us as we crouch low behind the snow-bank. The business now begins to get awkward, for we are very close to the brute, and below him; both rifles are empty, and I have stupidly left the ammunition with the other shikaree, who has considered it prudent to remain below, and with whom we dare not communicate lest the bear may detect us—and judging from the surly glances he casts around, he is quite prepared to make himself exceedingly disagreeable should he catch sight of us. Ramzan, in a smothered whisper, suggests that as the beast looks “bobbery,” as he expresses it, we should make ourselves as small as possible behind our cover, and thus await

the issue of events. Like pancakes we therefore continue to lie flat, merely raising our eyes carefully now and again for a peep, until at length, as his strength fails him, he begins sliding slowly down the slippery incline. Immediately he reaches our level, up we jump, and with a view to getting well above him, take to our scrapers upward, for we can see he is now too far gone to charge up-hill after us, though he makes abortive attempts to do so. We can now shout to the man below to bring up the ammunition by a circuitous route, so as to avoid the bear, which is still quite capable of doing damage down-hill, and on its arrival a quietus is administered to this tough and ugly customer—a huge male, and, I think, the biggest brown bear of the many I saw in these mountains, and I am certain I never killed a larger. We left the defunct brute as he lay, sprawling on the snow, it being now too late that evening to perform his obsequies.

So much snow had fallen overnight, and was still falling, on the heights above, that crossing the pass next day was out of the question; so, by way of employment, I accompanied the men who went to skin Bruin. We had hardly set out when on came the snow again heavier than ever. Nearly two inches must have fallen ere we returned from our task, during which we nearly perished with cold.

All day, and all that night, snow fell almost incessantly. By morning it lay so deep that my little tent was half-buried in it, and could scarcely support its weight. My native followers had contrived to make themselves pretty snug by constructing little huts of bent birch-boughs covered over with birch-bark, and were doubtless warmer and more comfortable than I was in my tent. Cashmerees generally manage to keep themselves warm in the coldest weather with their *kangrees* (small earthenware bowls covered with basket-work), which they fill with red-hot ashes, and, when either sitting or lying, place under the long sack-like gowns, which are invariably worn by both sexes in Cashmere.

There was now barely sufficient food for two days left, and I was beginning to think that, if the snowstorm con-

Cashmere "Kangree" or fire-basket.

tinued, we should have to pay another cold visit to the dead bear—this time for meat. Under such circumstances there was nothing to be done but to retrace our steps down the glen, and make for Mārroo by the lower route, for Ramzan said it would now be as useless as dangerous to attempt

the upper one. Indeed, from the ominous rumbling sounds which were occasionally heard in that direction, we could tell that avalanches were falling there; so we struck the camp, and commenced plodding down through the snow.

Although we started at daylight, and the distance was not very great, we did not reach the foot of the glen until evening. What a wearisome trudge it was, too, with the cold sleet beating pitilessly down on us as we floundered through the deep soft snow! The shikarees and myself had enough to do in helping the coolies along with their loads, until lower down we got clear of it. Shortly before reaching our camping-place, we came across a fine brown bear, which I managed to slay with one bullet. This was some compensation for the hard day's work.

Next day we reached Mārroo, a cultivated little valley containing several villages, and surrounded by lofty, precipitous mountains, our way to it having led down beside the rapid broken stream which flows through the grand main valley of Wurdwan, and forms the principal affluent of one of the five great rivers of the Punjab, the Chenab.

Having found fairly comfortable quarters in the open

wooden balcony of a house at Mārroo, I determined to remain there until the weather became more settled. After a day or two it began to show signs of improvement, when Ramzan suggested our making a short move to a place farther down the valley, on the heights above which, he said, we should be pretty certain to find ibex at that season. Whilst fixing up our camp there under some fine old trees, we were apprised, by the sudden rustling of the leaves overhead, the oscillation of the ground under foot, and a mysterious rumbling sound, that we were experiencing a sharp shock of an earthquake.

By dawn next morning we were breasting the hill, and after a stiff and steady climb reached the ibex haunts about noon.

“Look! there are khel up yonder, just below the snow!” said Ramzan, as his keen practised eye soon sighted a herd of some six or seven ibex far away above us; and with the spy-glass we could see that amongst them was one patriarchal old buck. They were all taking a siesta on a rocky ridge that ran down from the bare crags and snow-fields on the upper part of the range.

“The *bundobust* (arrangement) will be very difficult, for there is no way of getting above them,” remarked Ramzan, as he proceeded to gird up his loins with the skirt of his long woollen gown, whilst he carefully scanned the intervening ground. A sudden change had come over his usual listless air. His hitherto impassive countenance brightened up with intelligence and excitement at the prospect of circumventing an animal he considered worthy of a difficult stalk, or *bundobust* as he termed it, and he now became as active and wary as a wild cat, whilst we cautiously approached our game.

By means of his clever *bundobust*, then—for stalking ibex from below is always a difficult business—we at length got within what I imagined to be sixty yards or so of the big buck, as he lay on a small projecting ledge of ground almost

directly above us, with his head and shoulders showing over it, his splendid knotted horns sweeping grandly backward against the sky. He seemed so close and so large that I thought it unnecessary to raise any sight. Cautiously placing my cap on the top of a rock as a rest for the rifle, I aimed point-blank at his chest, fully expecting to see him the next moment roll lifeless from his perch. But, to my amazement and concern, he jumped up and disappeared like magic, before I had time to think of giving him the contents of the second barrel. When we next sighted him, he was well out of range, though I chanced another shot at him as he now took his way slowly but steadily up the mountain-side.

My anguish at that moment is impossible to describe. An almost irresistible inclination to fling the empty rifle after him suddenly seized me, as I helplessly gazed at his retreating form. To make matters worse, my companions would keep repeating, "Oho! what a pity! he *was* such a big khel!" accompanied by that well-known but indescribable sound made with the tongue and teeth, indicative of disappointment, thereby aggravating me to such a degree that I fear I must have used very hard language towards them.

Still clinging to the faint hope that the ibex might perhaps show symptoms of being wounded, as he had separated from the herd, we continued to watch him as he traversed a broad snow-field, on which, in the distance, he looked like a fly on a whitewashed wall, until he at length disappeared over the crest of the range, where it was to us inaccessible. My attention had been so much engrossed by the big buck that I failed to observe what had become of his smaller companions.

With a heavy heart I now climbed up to inspect the place where the ibex had been lying, when the distance to it was found to be much greater than it had at first appeared. The bullet had struck just under the spot from

which the animal had risen, and, after perforating the ground he was resting on, had in all probability entered his stomach. This perhaps accounted for his starting off in such a hurry, and separating himself from the herd, such being very unusual with ibex that have not been much disturbed, if unwounded. I had misjudged the distance, owing to my having, at that time, but a vague idea of the size of a full-grown buck ibex. Such a misfortune as this would not, however, be likely to occur with the flat trajectory rifles of the present day.

The full-grown buck ibex of the Himalayas (*Capra sibirica*), or khel, as it is called in the mountains of Cashmere, and more eastward on the Himalayas "skin," stands about 3 feet 6 inches at the shoulder, and is very stoutly built. Its general appearance, haunts, and habits are much the same as those of the Alpine "bouquetin," or "steinbok," but it attains a much larger size of both body and horn. The colour of the ibex is not easily described, as, like that of most wild animals, it alters considerably at different seasons of the year, and some bucks are very much darker than others. In the spring it is a very dirty white, shaded off on the shoulders and flanks into a brownish grey, which merges into brown on the legs. A brown line runs along the back, ending in a very dark-brown short tail. The head and neck are reddish brown, and a nearly black beard, about 6 inches long, depends from the chin. Late in the season the dirty white becomes more decidedly brown. Under the rough outer coat grows a soft kind of down known as "pushum," which, like that of the domestic goat of these mountains, is used in the manufacture of the finest of Cashmere fabrics called "pushmeena," of which the shawls are made.

The general appearance of the magnificent curved and knotted horns of the ibex are well known. But they are often misrepresented in drawings of the animal as sweeping high over the back, instead of merely curving over the

shoulders as they in reality do. The doe is much smaller than the full-grown buck, and her colour a light-reddish brown. She carries thin stumps of horns, which seldom grow longer than a foot; whereas those of the buck sometimes reach a length of 50 inches or even more, and a girth of quite 10 inches at the base. A crease round the horn denotes its yearly growth, not the knobs on its anterior surface, as is often supposed.

From what I have seen and heard of ibex, their sense of smell is not nearly so acute as their sight. But they seldom apprehend danger from above, so it is best to approach them, if possible, from that direction. During the spring and early summer, they may be seen feeding at almost any time of day, on the green patches of herbage, among the higher crags and snow-fields, only taking a siesta for a few hours at a time. In the dead of winter they are found much lower on the mountain-sides.

Provided they do not see the hunter, they are not always scared away by firing, probably from their being so accustomed to hearing the noise of falling rocks and avalanches. And sometimes they get so bewildered by the echoes of a shot, that they give time for several easy chances before making up their minds to be off. If one of them, however, catches only a glimpse of anything suspicious, a warning whistle at once sends off the whole herd, although they often depart very leisurely even after being shot at.

Ibex sometimes congregate in large numbers, but they are usually found in flocks of from six or seven to twenty or so, the older bucks often herding separately, except during the rutting season. Despite the quantities that are shot, killed by avalanches, and by those terrible foes to all Himalayan game, wild dogs, there appears to be little decrease in their numbers on the more sequestered hunting-grounds; for they are very prolific, each doe having as a rule a pair of kids every summer. The villagers sometimes train their dogs to hunt them down, when the ibex

become so stupefied with terror that they are then easily approached and shot.

I asked old Ramzan if the popular legend about ibex leaping down from great heights and alighting on their horns was current in those mountains, and was much struck with the intelligence of his reply. He said that ibex, when hard pressed, would sometimes jump down almost incredible distances, and on their fore feet touching the ground, their horns, from their great weight, were thrown forward, causing them to appear as if the animals had intentionally alighted on them. This, he thought, might perhaps have given rise to the idea.

Although ibex are so numerous, finding old bucks is often very chance work. Sometimes the sportsman may have to toil away for many days, or even weeks, without getting a shot at them. But if he is in luck, he may knock over four or five fine old fellows in as many days. The Himalayan ibex is tolerably plentiful in certain localities as far east as the province of Spiti, but is not found eastward of the river Sutlej.

Another variety of ibex (*Capra caucasica*), which I have never seen, inhabits some of the mountains of Western India, in Scind, but I am told it is very similar to the ibex of Western Asia, the horns of which are slighter and less closely knotted than those of the Himalayan kind; and the so-called ibex of the Neilgherry hills in Madras (*Hemitragus hylocrius*) appears to be totally different from both the above, with short horns more resembling those of the tahr.

But to return to the pursuit of the animal. The day after our disappointment with the big buck was devoted to hunting over another spur of the range, but nothing was seen except a couple of does. We had tasted no venison since entering Wurdwan, so I resolved to try for one of them to supply meat for camp use. As the stalk was rather long and difficult, the trouble it cost us to get a shot was hardly repaid by the flesh, which at that season

is dry and tough. In fact, my instincts for the time being were like those of the man who, as the story goes, whilst stealing up to some wild-duck, regretfully remarked to his companion in the stalk, "By Jove! we've got no lemons,"—more gastronomic than sporting. Our work, however, had so sharpened my appetite that no sauce was, in this case, necessary for assisting it. So we skinned and cut up the ibex where it had fallen, made a fire of dry juniper-sticks, and cooked some strips of the liver on the embers. This frugal repast was done ample justice to, despite its having no seasoning but the wood-ashes that stuck to the frizzled meat.

On our return to our quarters at Mārroo next day, we found that all the supplies collected for me had, during our absence, been appropriated by a man who was catering for the similar requirements of some other sportsman in Wurdwan. So we had to wait until more could be procured before proceeding to pastures new.

CHAPTER IX.

THE mountains on both sides of the Furriabadee river, and around its sources, were at that time considered about the best of ibex grounds, and probably they are so still, for there are sanctuaries among them to which the ibex can betake themselves, and where no human foot can follow.

The Furriabadee, which drains the snow-fields and numerous glaciers about its sources in Sooroo, joins the Wurdwan river at Mārroo, whence we now directed our steps up its magnificently wild valley. After proceeding about seven miles, we pitched our camp beside a fine hot spring, in which I enjoyed the luxury of a warm bath. From the semi-civilised evidences about this wild romantic spot, I judged it must have been considered a sort of Leukerbad by the good people of Mārroo; for over the stone tank of steaming warm water, there was a construction of neatly-squared logs, with an upper half-open storey, where the invalid bather could rest after the bath, and enjoy the grand prospect and salubrious mountain air without feeling the cold. In fact, Ramzan informed me that such was the intention.

Although not an invalid, the refreshing effect of a warm bath certainly made me feel more fit to climb the steep hill-side next morning. After a long ascent, however, I was not sorry to sit down and search the ground with the spying-glass, when we soon discovered a herd of ibex about a mile off, and far above us. None of the animals were very big old bucks, but as some of them carried fairly good

horns, we arranged for a stalk. By the time we neared the place where we had first sighted them, they had moved off into very precipitous ground, where they were masters of the situation, and were soon lost to view. As it was impossible to follow them, on account of a wide intervening chasm, we concealed ourselves among the rocks, and there waited for several hours, until they reappeared and commenced to feed.

As we lay there, hoping that they would shift their ground to where it might be more practicable for a stalk, it was interesting to watch them through the glass. Some were feeding leisurely on the patches of herbage among the rocks, whilst others lay resting their horns on the ground, or amused themselves by having a playful tilt. But I observed that there was always a sentinel, generally a doe, on the watch for danger. As the sun was getting low, and we were far from camp, I was at last most reluctantly obliged to shut up the telescope and leave them to their gambols.

Whilst descending we discovered two brown bears feeding on the opposite side of a deep wide gully. They were a considerable way off, but I longed to hear the "crack" of my rifle again, so, at the risk of getting benighted, we proceeded to look them up. They were on an open slope, but by dint of constantly tossing up bits of dry grass to try the wind, which, as is usual among mountains, was very shifty, we managed with some difficulty to keep to leeward of them. On reaching the place where they had at first been seen, there was only one now visible. To him I contrived to creep close up, as his attention was engaged in sniffing about and turning over the stones with his paws in search of insects, when a single bullet, planted well behind the shoulder, sufficed. After a few whining grunts and vain efforts to turn round and bite at his wound, he rolled over to rise no more.

Leaving one of the men to skin him, Ramzan and I now proceeded to search for his companion, which we concluded

"ON THE WATCH."

must be somewhere near, as she had not been seen to make off. We soon discovered her some distance farther down, and apparently quite undisturbed by the shot that had deprived her of her mate, for she was busily engaged grubbing after roots; and working on either side of her were a pair of cubs, which we had not before observed. As they were on very bare ground, and as we had this time the nasal and visual organs of three animals instead of one to take into account, it was impossible to get nearer than a hundred yards. At first I felt somewhat loath to disturb this interesting family party, which I continued to watch for some time, until its members began to show signs of uneasiness in their minds by every now and then sitting up on their haunches and suspiciously turning their noses towards us. As I considered the youngsters quite big enough to take care of themselves, I aimed deliberately at the old lady and let drive; she rolled a short distance down the hill, and, after a few struggles and grunts, expired.

The two cubs at first merely stood up on their hind legs and gazed about them with much apparent astonishment. But on seeing their mother lying motionless below, they at once ran down to her, when their behaviour was such that I felt quite sorry I had shot her. The anxiety they plainly evinced, as they ran grunting and sniffing about their defunct parent, was quite touching to behold. Even on observing us as we approached they seemed very unwilling to leave her. When they at last made up their mind to do so, they merely retired into an adjacent patch of wood, where they continued their whining lamentations, occasionally venturing out a few yards to stand upright and watch us as we ruthlessly stripped their dam of her hairy coat, and did not take their final departure until we gave chase, thinking we might capture them. Although they were too small to shoot, they were quite knowing enough not to allow themselves to be caught.

By the time we had finished skinning the bears, the short

twilight had deepened almost into darkness. As we had still far to go, we got benighted on the hill, and had some difficulty in finding our way down to a small hamlet. Here we procured torches made of bits of resinous pine-wood, and, with their light, soon reached our camp about a mile farther on, after having been on the hill for sixteen hours.

Ramzan now recommended our moving a few miles farther up the glen to a place where there were two or three log-huts, the highest habitations in the glen, and then striking off on to the range above them, where he thought we should be pretty sure to find big bucks. Leaving the tents where they stood, some blankets and other necessaries for passing a few days on the hill were rolled up, and the same evening we reached the huts. A fine brown bear, which we came upon shortly after leaving the hot spring, was summarily disposed of.

Accompanied by a guide from the huts, next morning we were far up the mountain-side ere the sun topped the multi-form crests rising along the ridge of eternal snow and lighted up such a sublimely grand prospect of fell, forest, and flood as could hardly be surpassed. Immediately on either side of the foaming torrent that roared sullenly below and filled the valley with a sullen resonance, the mountains rose in rugged precipices, rocky amphitheatres, and abrupt spurs towards the huge naked crags and shining snow-piles that stood out in awful magnificence and with surprising distinctness against the deep blue morning sky; two mighty twin-like peaks, Noon and Koon, shooting up among their less lofty neighbours to a height of over 23,000 feet above sea-level. Glaciers lay in the hollows between some of the higher spurs, whilst broad fields of glistening snow filled the head of the main valley. Farther down it the steep mountain-sides were, above, bright with green birch-woods, below, dark with vast tracts of sombre-hued pine-forest, which here and there seemed as if rent from top to bottom, where long lines of uprooted and broken pine-trunks, masses of earth-

soiled snow and *débris*, marked the course of avalanches that had recently swept down from the towering heights into the blue depths beneath. Not even among the finest scenery of the Alps have I ever seen anything to surpass this view in beauty, or to equal it in grandeur.

But whilst I have been admiring the prospect, Ramzan has made good use of the glass, and has espied a herd of ibex far away among the crags above. After planning our stalk we commence working towards them, but the ground we have to get over is in many places so difficult that we are several hours in approaching them. We are constantly employed in cutting steps in the hard slippery snow, where we are often obliged to cross steep fields of it, and on which the result of a slip might be unpleasantly doubtful. After a time, however, one gets accustomed to such places. Moreover, they often at first appear worse than they really are, for if the crust is hard and the notches well cut, a fair cragsman, with a little care, is almost as safe as though he were walking along "the shady side of Pall Mall," if his nerves would only allow him to believe so. But there are certain conditions of these snow-slopes when crossing them becomes ticklish work. I have never heard of the rope being used by sportsmen in the Himalayas, as game is not usually found above the limit of vegetation, unless driven to seek safety in higher and less accessible regions; therefore, being tied to your companions need seldom be resorted to as an absolute necessity in Himalayan hunting.

At last we get to within 150 yards or so of the place where the ibex are now reposing in a little corrie. But the best bucks are hidden from view, and we cannot get nearer without being detected. After waiting patiently there for an hour or more, and calculating with much satisfaction upon the certainty of, sooner or later, getting an easy chance, we are much surprised at hearing one of the beasts sound its alarm-whistle; for we are well hidden from them, and the wind is right. But we soon discover that the animal's

keen vision has been attracted by something below, which it is intently watching, and after a few minutes we have the mortification of seeing the whole herd slowly walking away up the hill. Both rifles are emptied, and apparently without effect, for the animals still continue steadily to ascend without increasing their pace, until they disappear over the crags some distance above.

On turning our attention towards the cause of their disquietude, we descry a small white speck moving up the hillside, far away below. To our intense disgust, the spy-glass shows it to be the big white turban of the impostor, who had been left behind to clean and stretch the skin¹ of the bear I had shot the day before. The useless idiot was now following us straight up the hill, without the slightest attempt at concealment. If he could only have heard the Cashmerian "Billingsgate" applied to himself and his kindred by my two companions, they would not have felt flattered, and I did not bless him myself.

We now climb up to the place where the ibex disappeared, and are astonished to find one of them lying wounded among the rocks just beyond it, but on seeing us it instantly jumps up and makes off. I let drive a flurried shot after it, and miss. Whilst following this animal we find blood on the tracks of a second, and as they are larger than those of the first, we follow them up until the declining sun warns us not to risk being again overtaken by darkness so high up on the hill. We therefore descend to a small cave where Ramzan had proposed we should pass the night.

The greater part of next day was occupied in tracking the wounded animals, but they had betaken themselves to such

¹ The simplest way to temporarily cure a bear's skin is to peg it out on the ground and cover it with white wood-ashes from your camp-fire. These should repeatedly be rubbed into the skin with a rough stone. The paws, lips, and roots of the ears should have a little salt rubbed into them, and the cartilage of the ears should be skinned as far up as possible, otherwise the hair is apt to fall off.

bad ground that at length it became impossible to follow them any farther.

For nearly a month had I been perspiring over these heart-breaking hills, and I was now beginning to think that such profitless toil was only vanity and vexation of spirit, and that these infernal ibex were merely a delusive wile of some mocking demon of the mountains who was amusing himself at my expense. So disheartened had I become from persistent ill-luck and bad shooting, that it needed a good deal of persuasion on Ramzan's part to induce me to continue our pursuit of the beasts; for fatigue, disappointment, and bad weather combined, were beginning to tell on my powers of endurance and patience. "Try just a few more days, and our luck may change," said the old man. Indeed he appeared so anxious to cheer me up that it seemed almost as though he had some presentiment of coming good fortune.

Again we were toiling up the steep acclivities of the range which is known by the very appropriate name of "Dook" (trouble or pain). We had hardly been gone an hour when a herd of large old bucks was suddenly descried in comparatively easy ground for a stalk. In a second we were all prone on the earth; but there was a troubled look about Ramzan's face as he lay beside me anxiously watching the animals, and my spirits sank to zero when he whispered, "They've seen us." The glass was at once brought to bear on them, for they were a considerable distance above us. There were six, all of them carrying splendid sweeping horns, and to my inexpressible delight I discovered that, for once, the old man was wrong, as, after a short time, one of the beasts lay down, and his example was soon followed by his companions. Inch by inch we cautiously wormed our prostrate bodies backwards until we reached the edge of a gully, in which we were hidden from view of the herd, when Ramzan relieved his feelings of doubt by taking a huge pinch of snuff.

By following the long and steep windings of the gully, we at length got within easy range of the animals. My sagacious

old companion, after carefully reconnoitring their position, then sat down, and with a most self-satisfied air again applied himself to his snuff-box, at the same time suggesting that, as the ibex would be pretty safe not to move for some time, I should wait for my nerves to get steady, and until I recovered the breath I had lost during our scrambling stalk. He then produced an apple from the capacious pocket of his long woollen garment and gave me it to eat, a practice common with him on such occasions.

How quickly my heart throbbed, nevertheless, as I cautiously peered from behind a rock at those six beauties, whose horns all looked so equally large that I was at a loss to choose which to shoot at. As the nearest offered the best chance, I levelled at his chest, which was towards me. The report of the rifle was instantly followed by a tremendous clatter as the six animals sprang to their feet and galloped away, apparently scathless, barely giving me time to take aim with the second barrel, which was emptied at one of them just as they were disappearing over a ridge.

I was speechless with vexation. No language, however strong and expressive, could at that moment have relieved my harrowed feelings. Even my Cashmeree companions seemed this time to respect my silent woe, for they gave vent to none of their usual confounded ejaculations either of disappointment or condolence. But the looks of contemptuous pity for my performance they cast towards me were just as hard to bear, making me feel half inclined to "loose off" both barrels—fortunately they were empty—at them, and then fling myself, rifle and all, headlong among the rocks below. I was very much younger and less experienced in human nature then than I am now. Poor innocent men! I should have known that they were only deeply lamenting the loss of the meat, and not pretending to commiserate my misfortunes.

When my frenzied state of mind became calm enough for me to think and act like a rational being, I came to the conclusion that, after all, matters might perhaps not be so

bad as they seemed. Whilst I was impatiently reloading, Ramzan, who had run forward over the ridge to mark the herd, now reappeared on it, and, to my infinite relief and joy, shouted back that one of the ibex had dropped just beyond it. But, on getting up to him, I was again rather taken aback by the rueful expression of his countenance.

"Why, what's the matter?" said I. "It's all gone wrong," replied he, with a rapid succession of his exasperating interjections of disappointment. "What's all gone wrong?" I asked, with much anxiety and a little irritation, wondering what could possibly have happened now. "The khel, he's all spoilt," he testily answered. Not knowing what on earth to expect from all this, I proceeded, in a state of bewildered suspense, to where the buck had dropped. There the beast lay, stone dead, jammed between two rocks, and a bullet-hole in his chest testified to his being the first animal I had shot at. "Look!" said Ramzan, almost weeping, "he's quite dead, and all that meat is lost." What had happened began now to dawn on my perplexed mind. The ibex had expired before the old man had had time to bleed him. Consequently, according to his idea, the flesh was useless, for, of course, no good Mohammedan could eat of an animal which had not had its throat operated on by a follower of the Prophet with all customary form before the pulses ceased to beat, and Ramzan Meer was an extra-devout old Moslem.

My recovered energies were at once devoted to following up the second animal I had shot at, as, from the fact of our only observing four of the six bucks taking their way over the snow-fields far away above, we concluded that he too must have been hit, and so sorely as to be unable to keep up with the rest. But, unfortunately, we could find no traces of him to guide us, so we returned to flay the dead one.

After stripping the ibex of his head and skin, I reluctantly had to leave most of the meat for the bears and eagles—as the Cashmerees would not eat of an animal that had not had the "hullal" duly performed on it—and descended

to a small sheltered plateau where we intended to bivouac for the night.

Towards evening, as we sat preparing the head, a man I had sent up to watch what remained of the dead ibex—in case of a bear getting a sniff of the meat—came tearing down the hill, gesticulating as he ran, and, on nearing us, breathlessly ejaculating “Khel! khel!” When his excitement became more subdued, we learnt from him that he had seen a large herd of ibex on the hillside above, and only about half a mile off. Sharp is the word. The covers are at once slipped off the rifles, and we are not long in reaching the place whence the animals had been sighted, when, sure enough, there they are, about sixteen in number, and two of them grand bucks; but the ground is bad for approaching them. As they are feeding towards us, we wait patiently there until, at length, a keen cold wind most opportunely begins to blow towards us, driving them all down for shelter into an intervening corrie, and bringing them within a longish range of our position. During all this time Ramzan, in half-suppressed pious expressions, keeps incessantly imploring the assistance of the Prophet. But now one of the does, becoming suspicious of danger, gives her warning note. There is no use in waiting longer, as the whole herd at once begins moving slowly off; so I single out the finer of the two big bucks, which in a few seconds falls rolling and struggling down the hillside. “Shabash!” (bravo) exclaims Ramzan. “Now for the other big one.” A bullet speeds after him, but from want of “straight powder” he gets off uninjured. The men are determined this time not to lose *their* spoils, for they reach the fallen buck almost before the echoes of the last shot cease rolling and reverberating among the crags and precipices, when they bleed him with all due form. Leaving two men who had followed us to break up the ibex, Ramzan and I descend to our bivouac, from whence we send them a flaming pine-torch to light them down after finishing their work, for by this time it has grown almost dark.

It was with a light heart and a keen appetite I that evening despatched my frugal meal of broiled ibex-meat and "chuppaties" (thin cakes made of flour and water). After a "nightcap" of hot whisky-toddy and a few puffs of tobacco beside the fire, notwithstanding very tough venison, and a hard couch under no roof but the starlit sky, I was soon ibex-hunting in dreamland.

In a few more days we were recrossing the Mergun pass *en route* for Srinuggur. The snow had almost entirely disappeared from the summit of the pass, which was now clothed with short green turf, thickly besprinkled with buttercups, their bright colour presenting a strange and pleasing contrast to the savage aspect of the bare grey rocks and partially snow-clad heights on either side.

On reaching our first camping-place in "the Vale," I was told that black bears were numerous in the vicinity, they having come down into the mulberry-groves to feast on the fruit, which was then—the month of June—in full season. Although this kind of sport is rather tame after mountain work, it is by no means to be despised. I therefore determined to devote a day or two to looking up Bruin in his feeding-grounds. The first morning I failed to get a shot, although I was very close to one fellow, where he had ensconced himself among a lot of thick bushes, which effectually covered his retreat as he bolted. Next time we went out I had better luck, when I secured the only bear we saw, after putting several bullets through his black hide. The same evening we found another munching away quite at his ease in a mulberry-tree, when a ball sent into his back as he stood up stretching out his paws to gather the fruit, brought him down with a loud "yeeough" from the tree, at the foot of which we found him dead, his mouth full of mulberries, poor beast! A leopard was also seen at dusk by Ramzan as it slunk away through the bushes quite close to us.

One of my first excursions on arrival at Srinuggur was with a view to getting thoroughly cleansed at a hummām,

kept by a queer character then well known in Srinuggur, as barber to the European visitors, and dentist, chiropodist, and general practitioner as well, among the citizens. As may be supposed, old Mirza's establishment was not fitted up with that luxurious elegance one finds in Jermyn Street. Indeed, on first entering the hot dusky hole of a place, which reeked with the vapour of stale warm water, it required only a slight stretch of imagination to fancy one's self in some dungeon of old, and that Mirza and his assistant—as they stood there in the dim steaming atmosphere, stripped naked, save a dirty rag round their loins, their swarthy skins streaming with perspiration—were the executioners ready to seize their victim for torture. To further this idea, they both pounced upon me, laid me flat along the hot flagstones of the floor, and commenced what seemed to be vigorous attempts at dislocating my joints and flaying me, accompanying their exertions with sundry grunts and startling exclamations that sounded quite fiendish as they rang through the stone-vaulted chamber. The only intermission in their labours was when old Mirza, whose ideas were inclined to be socialistic, would sometimes, by way of taking a short rest, begin breathlessly abusing the ruling authorities in rather unparliamentary language. After thus giving vent to his political opinions, he would resume the peeling process with renewed energy. Thus far I quietly submitted to their operations; but when the principal torturer, with a demoniacal grin, proposed immersing me in a dirty stone cistern full of scalding-hot greasy-looking water, I objected to further proceedings. After drying and dressing myself with the utmost expedition, I made my exit into fresh air with the least possible delay, vowing never again to try a hummām in Cashmere.

My companion returned from the mountains a few days after me, bringing with him, amongst other trophies, one of the most massive and altogether perfect pair of ibex horns I have ever seen. They were upwards of 4 feet long, with

a wide and regular sweep, and their tips uninjured. Poor lad! he was not long permitted to enjoy their possession, for a short time after he fell a victim to that fearful scourge of India—cholera. He was a true sportsman and an excellent rifle-shot; and his shikaree told me he had never been out with a more daring or surer-footed European cragsman. One of his last wishes on his deathbed was that his hunting trophies might be sent home to his father. Strange to say, he had a fixed presentiment, to which he often gave expression, that he should never see Almora, where our regiment had been ordered to shortly before he died; and sad to say, this was fulfilled.

Very fair fishing was to be had in the valley at certain seasons in some parts of the Jhelum, both for mahseer and silvery black-speckled fish, in appearance like trout, but wanting the second rayless dorsal-fin of the Salmonidæ. The former fish were comparatively small of their kind, those killed being seldom over 10 lb. or so. The latter were sometimes taken up to 8 lb. or more. The minnow was usually most successful for mahseer. The other fish took the fly pretty freely, and the fly that seemed as good as any was made simply with a bunch of white-cotton thread carded out and tied on to a naked hook. But the deadliest bait was a ripe mulberry, when the fruit was in season. The boatmen were rather clever at spearing small fish in shoal water from the bows of their boats.

Formerly, fishing was permitted anywhere in the river, but latterly it was prohibited between certain bridges in the city, for, as was alleged, the following ridiculous reason:—

The story went that, after the death of the Maharajah Gholab Sing, his soul was believed to have transmigrated into a certain very big mahseer in one of the sacred fish-tanks near Islamabad, where, with many smaller companions, this holy fish was well fed and cared for by the attendant Brahmin priests. One day a hungry sportsman, on his

return from the mountains, pitched his tent near this tank, and seeing the fine fat fish it contained, straightway proceeded to avail himself of the chance thus offered of so easily providing himself a savoury meal. To the horror and consternation of the priests, he hooked the "Maharajah," and soon had him cooking for his supper. This catastrophe caused a tremendous rumpus, which resulted, I believe, in the author of it being ordered to quit the valley. Subsequently the spirit of the defunct old ruler was supposed to have returned to the capital, and to have been re-embodied in another big fish, whose haunt in the river was said to be somewhere opposite the palace, between two of the old wooden bridges; and so it came about that fishing in that bit of the water was proscribed.

The metropolis of Cashmere,¹ with its picturesque canal communications, quaint old bridges, gondola-style of boating, and bad smells, often reminded me of Venice. Reclining under the straw-mat awning of your Cashmerian gondola, or "shikaree" boat, as this water-cab of the country is called, whilst being paddled over the limpid glassy water of the beautiful Dhal lake, through the *singara*² plants, and past the large flat leaves and gorgeous red flowers of the lotus, or among the floating gardens;³ lunching *al fresco* on the Isle of Chenars, or beside fountains and miniature cascades at the Shalimar or Nishāt gardens, and returning in the bright moonlight, your boatmen keeping time with

¹ Ozaka in Japan, with its canals and wooden houses, boats and bridges, struck me as bearing a greater resemblance to Srinuggur in Cashmere than any other place I have seen. They differ, however, in respect of the former being remarkably clean, whilst the latter is filthily dirty. Indeed, I may say in many ways Japan resembled Cashmere.

² The water-nut, much used for food by the poor class of Cashmerees.

³ These floating gardens, so called, are considerable sized beds of earth, with their foundations of matted reeds and grass so constructed as to be quite disconnected with the bottom of the lake. In order to prevent their being drifted away, they are attached to long poles driven into the bed of the lake where it is rather shallow. They are used chiefly for the growth of melon, cucumber, and suchlike plants.

their paddles to some wild 'Cashmere lay; or visiting the shawl-merchants' shops and sipping spiced tea whilst inspecting their beautiful wares,—were all very delightful by

The Gondola of Cashmere.

way of rest after hard mountain work. And here I may remark, with respect to the shawl fabrics, that if some of their fair wearers could behold the half-starved emaciated creatures who weave them, they would not rest so lightly on their shoulders. I noticed that many of these poor artisans had a permanent squint, acquired, I was told, from being kept so constantly employed at their primitive hand-looms on this fine work.

Charming as the *dolce far niente* style of life in this bewitching valley was for a time, I returned ere long to the ibex and bears among the mountains. As I have probably said more than enough about ibex-hunting, I shall not tire the reader with a repetition of it, but commence another chapter of wild sport in quite a different locality.

CHAPTER X.

THE position and general features of the beautiful valley of Dehra Doon have been mentioned in a foregoing chapter. As it lies within the Sewalik hills, which may be classed among the outer ranges, the sport to be had in its wild tracts of forest and swamp may, I think, be called Himalayan.

When I first knew the Doon, game of many sorts and sizes was abundant, from a button quail to a wild elephant, or from a minnow to a mahseer of a hundred pounds. From time out of mind it must have been a favourite haunt of wild animals, for many fossil remains of huge antediluvian creatures—the mastodon, for example—have been found in the Sewalik range, which bounds the valley on its south side.

From the beginning of June until the end of October the heavy jungles and swamps of the Doon, like those of the Terai, are deadly; but for the rest of the year they are comparatively free from malaria.

During the many years I passed at intervals in these “happy hunting-grounds,” my shikar experiences were so numerous and varied that I shall endeavour to describe one or two only of those best suited to give a general idea of the wild sport of this locality.

The quantity of small game was formerly far greater than it was even within my own recollection, more particularly in the western part of the valley, where the

ground in some places was pretty clear of forest, and where tracts of long grass, intersected by streams, were interspersed with patches of cultivation, sedgy marshes, and bush jungle, in which kind of ground the black partridge delights. Here were also to be found hares, pea-fowl, jungle-fowl, wild-fowl, grey partridges, plovers, several kinds of snipe and quails, and sometimes a floriken, a few sand-grouse, and occasionally a woodcock, &c.

When beating for small game, a sounder of wild pigs, or a deer, was not unfrequently driven from among the long grass and bushes, and I have known of a leopard, and even the striped king of the forest, having been disturbed in like manner. But as regards the two latter, such instances were rare, as feline animals, although numerous in the adjacent jungles, seldom ventured during the daytime into the open. Just before nightfall, however, they often prowled out after the village cattle. I remember, one evening when skirting along the margin of the forest after any game that might chance to turn up, coming unexpectedly upon a tiger as it was coolly taking its way down a wood-carting track towards the open country. This animal, when he saw our elephants slowly advancing within eighty yards, merely stopped short and slowly retraced his steps. The shot which I lost no time in letting go, was replied to by the deep guttural grunt which a tiger almost invariably gives vent to when a bullet tells on him. Wheeling suddenly round, he struck a heavy blow with his paw at a tree that stood in his way, and forthwith charged straight down on the line. Grunting forth his wrath, he dashed open-mouthed right in among the elephants, when a lucky bullet from one of the other guns caught him in the head and stopped his further progress *instantly*. The first shot was found to have gone clean through him, close behind the shoulders. This serves to show what a tiger is capable of doing after being mortally wounded. On another occasion, in broad daylight, I shot a leopard in a jungly ravine, within a few hundred yards

of my house, where it had killed one of my servant's goats.

The prettiest sport of the Doon was the stalking in the Sewaliks. But the spear-grass that grows most abundantly there, as also on the lower ranges, is, when long and dry, dreadfully troublesome. The sharp barbed points of the thin hard seeds, from which it derives its name, catch in your clothes, and work themselves by myriads through them, and even down into your boots, until they reach your skin, which they often penetrate. In this comparatively low but rugged and forest-clad range of hills, the jurrow (called *māhā* in the Doon), the spotted deer (called *cheetal*), and the *kakur*, or barking-deer, were plentiful; and up about the jagged and precipitous sandstone summits of the range, *gooral* might always be found. Tigers and leopards, too, were numerous, though not often seen, and wild elephants were not uncommon. Shooting the latter, however, has now been prohibited by the Government, except in the case of a dangerous "rogue"; and very wisely, or *Elephas indicus* might soon have become as extinct as *Dinotherium giganteum*.

But for many years pot-hunters, by indiscriminate slaughter at all seasons, have been doing their worst to exterminate the game in the Doon, and have so far succeeded fairly well in their nefarious work—for good small-game shooting, at any rate, is now a thing of the past.

I shall first try to recount the proceedings of a day after small game that I find recorded in my old shooting-journal. It will serve as a fair sample of many similar days' sport in the Doon.

It was on one of those fine sharp mornings which are the rule in this beautiful valley during the cold season, that a party of three guns, consisting of a travelling visitor to the place—vulgarly called a "Globe-trotter"—the *Æsculapius* of my regiment, and myself, after an early breakfast, lit our "baccies" and mounted our little equine quadrupeds, known

in India as "tats." An hour's ride between thick clumps of tall feathery-foliaged bamboos—like gigantic ostrich-plumes—that sometimes flanked the road, or through umbrageous groves of grand old mango-trees, brought us to our ground, where a small crowd of beaters, gun-carriers, dogs, &c., had already preceded us. Our line being formed, we forthwith commenced business by beating up a few grassy fields and scattered patches of bushes, from which a hare, one or two grey partridges, and a few stray quails were transferred to the game-bag. I call them *stray* quails, because the common grey quail, being a migratory bird, is not found in any numbers except during a few weeks in the spring and autumn, although varieties called the rain-quail and bush-quail are met with at other times, the former only during the rainy season, the latter at any time, in bush jungle.

After quitting the fields, we beat through a sedgy swamp, where some long-bills, including several little jack-snipe, are picked up, whilst others twist away unscathed by our erratic shots. Our quota of snipe is added to by one or two of the painted variety, which rise from the longer reedy grass more like a big butterfly than a game-bird. On nearing a bushy corner of the "jheel" (marsh), the welcome cry, "Mark woodcock," comes from *Æsculapius* on the right of the line; and we have the satisfaction of seeing this much-prized bird alight in a thicket some distance ahead, where it is again flushed and falls to the gun of the "G. T."

Our beat now leads through long grass, beside a clear pebbly stream called the Sooswa, that derives its name from its abounding with water-cresses, broad luxuriant patches of which might be seen extending along its bed, sometimes for fifty yards or more in length. We have not proceeded far when "whir-r whir-r" go a brace of black partridge (francolin) as they rise high over the grass and make away with the dashing straightforward flight which is their wont. "Bang, bang" on the right goes our medical adviser, before

whose unerring barrels they are brought down in capital form, for he is as good a hand with his sporting implements as he is known to be with those of his craft.

A fair number of black partridges are accounted for ere we reach a more jungly part of our beat, when the cheery crowing of jungle-fowl and the musical cry of an old peacock advise us that we are likely to add variety to our bag. Presently there is a "yap yap" from the dogs, followed by such a clucking and general disturbance among the little cocks and hens, as some flutter up into the trees, whilst others, older and more wary, either scurry off through the bushes, or wing their rapid flight as they betake themselves to a safer locality, that it seems just as if we are in the vicinity of a poultry-yard. One or two of the less crafty ones are rather shamelessly potted on their perches, whence they fall almost into the jaws of the dogs that are barking at them below, by which diversion their attention has been distracted from us their more dangerous foes, as we approach them under cover of the bushes. The unusual row disturbs from its noonday repose a cheetal (spotted deer), to which our physician administers a dose of leaden pills, but at such a distance as to have little effect.

Our musical friend the peacock having betrayed his whereabouts by again raising his melodious voice—a practice usual with pea-fowl on hearing a shot in their vicinity, though they are otherwise uncommonly knowing—the old fellow is soon ejected by the dogs from his retreat among a tangled mass of elephantine creeper, where he has ensconced himself in the vain hope of concealment, and from which he extricates his splendid long train with considerable difficulty and much flapping of wings, thereby giving an easy chance to one of the party.

Now came a very agreeable and welcome part of the day's proceedings, when we called a halt in a shady nook beside the stream, where it formed itself into a deep swirling pool. From this, had we come provided with a trout-rod, we might

easily have added a dish of broiled fish to the cold collation that was being spread before us. Having done ample justice to the comestibles, and beverages cooled in the stream, after the usual pipe we prepared to make a fresh attack on the feathered denizens of the jungle. Although the quantity of ammunition expended was perhaps greater after lunch than before it, the amount of the bag, I fear, was, as it often is under similar circumstances, in the opposite ratio.

Towards evening my place in the line led me along a bank overhanging the stream, when I suddenly heard an unearthly skirling noise at the water's edge below me. On looking over, I found it proceeded from two young otters fighting over a fish. They were so taken up with their quarrel that they did not notice me until I had jumped down and collared one of them, like a ferret, round the neck. The other at once took to the water; but this being quite shallow for some distance, after depositing my gun I was able to give chase, and succeeded in heading the little beast before it reached the stream, and driving it back on to the shore, where I soon got hold of it, like its companion, with the other hand. The difficulty now was how to get rid of the struggling little wretches without either being bitten by them or letting them escape; for although they were not much bigger than ferrets, they were exceedingly strong, and their jaws were well provided with sharp teeth. The only thing we could devise for carrying them was a kind of bag made of one of the beater's turbans. Into this they were dropped, and slung over a man's back; and judging from the noises that issued from the bag, they seemed still to be carrying on their feud even there. After beating back to where we had left our ponies, we cantered home, well satisfied with our varied bag and our pleasant day's sport. The two otters eventually became tame enough to play about the house, although they would never permit themselves to be freely handled.

But alas! in the Dehra Doon at any rate, such halcyon

days are, I fear, numbered; for its jungles are being slowly but steadily cleared, and with them their wild denizens must as surely decrease. Indeed it is by no means improbable that ere very long the whistle of the "iron horse" may replace the "bell" of the deer and the "trumpet" of the wild elephant—sounds which of yore were wont to be heard in sylvan solitudes which are now replaced by extensive clearings for the cultivation of tea.

It was about the middle of March 1860, when Colonel (now General Sir Charles) Reid, commanding my regiment, invited me to join his shooting-camp in the eastern part of the Dehra Doon. He had "padded" two fine tigers during the few days he had been out before I joined him. This was unusually good luck for the Doon jungles, where, although tigers are pretty numerous, they are difficult to find when beating for them with a line of elephants, from their being so easily able to slink away unperceived in the almost impenetrable thickets and swampy cane-brakes with which the eastern Doon abounds. If, however, intelligence can be got of a tiger's having just killed a buffalo or bullock, and the carcass reached before the "choomars" (leather-tanners), who are always on the look-out for such events, have discovered it and stripped it of its hide and flesh, the chances of finding the animal at or near the "kill" are then pretty certain.

A delightful ride of about fifteen miles, chiefly through forest, brought me to an open spot where the jungle had been cleared, a few grass-huts erected, and the ground cultivated. Here I found the Colonel's camp pitched, and fortunately reached it just in time to escape a thorough drenching, as shortly after my arrival a terrific thunderstorm burst overhead, accompanied by high wind, which levelled one of the tents in no time.

When we mounted our elephants next morning the atmosphere was clear and cool, and our jungle surroundings looked beautifully bright and green after the storm. In front of

the camp, over the irregular line of tree-tops, rose the precipitous slopes and buttresses of the outer-range Himalayas, some three or four miles distant. Rearward, in like manner, the low serrated ridge of the wooded Sewaliks cut the deep-blue sky-line. We beat over some excellent-looking ground, but returned in the evening with empty pads—having agreed to fire at no other game whilst there was a chance of finding a striped jacket.

For the two following days we roamed through jungle and swamp without success, as far as tigers were concerned, although deer, wild pigs, and feathered game were plentiful enough. Sometimes a porcupine would hustle away among the long grass, from under the very trunk of one of our

In the Doon jungles.

elephants, the sudden rustle of its quills causing the huge beast to shriek and shy as much as, if not more than, if it had trodden on a tiger's tail. The amount of self-denial I had to exercise in refraining from pressing the trigger was often very considerable, as my rifle was brought to bear on

the shoulder of some fine cheetal stag, whilst he stood to gaze for a few moments at the elephants steadily forcing their way through the tangled jungle, when his sleek dappled coat and long tapering antlers would slowly disappear in the thick cover, as though the animal knew he had nothing to fear.

The manœuvres of an elephant whilst slowly forging its way through heavy jungle are quite an interesting study. The control its mahout (driver) has over the huge but docile animal is truly marvellous, as he verbally directs it here to tear down a tough obstructive creeper, or a projecting bough, with its trunk, there to fell with its forehead a good-sized tree that may impede its course in the line, or to break away some precipitous bank of a nullah (water-course) with its fore feet, to form a path for descending into it, and then, after the same fashion, to clamber up the opposite side. And if its driver should chance to drop his *guybag* (iron goad) among the long grass, with what confiding sagacity does the animal grope about for it and lift it up to him with its trunk! In tiger-shooting, however steady an elephant may naturally be, its behaviour very much depends on the conduct of its mahout. I may mention a remarkable instance of cool pluck on the part of a mahout, which occurred during a tiger-beat in the Dehra Doon. Amongst some elephants attached to my regiment, as transport for our ammunition on field service, was a very fast and steady one which had had the honour of carrying the Prince of Wales when tiger-shooting in the Kumaon Terai. The mahout who drove Alice, as she was named, always wore in his girdle a hunting-knife, which he showed with much pride as having been bestowed on him by his Royal Highness. One day, during a scrimmage with a tiger, this knife dropped from the man's girdle. "Oh, my knife! my knife!" he exclaimed, and instantly slipped down off his elephant's neck on to the ground to recover it, at the imminent risk of being boned by the tiger.

On the third day we visited the scene of the death of one of the Colonel's tigers, in hopes of further success, as the place was considered one of the best finds in the Doon; but this time we drew it blank. It was a long narrow swamp filled with flag-grass (called "putteyr"), which grew nearly as high as the elephants' pads, and almost surrounded with tree-jungle,—altogether about as perfect a bit of ground for holding a tiger as could be desired.

On one occasion when beating through this swamp, we had a funny adventure with a crocodile, which afforded us some sport, such as it was, and considerable merriment. The creature was lying among the flags, apparently taking a snooze, for it either paid no attention to or did not observe the approaching elephants, so I resolved to wake it up with a charge of buckshot on its cranium. On receiving the shot, it for the moment seemed stunned, but soon managed to wriggle its body into the soft mud among the roots of the flags, leaving only its tail visible, when a bright idea suggested itself to one of the Goorkhas who were with us. Thinking the animal was dead, or nearly so, he proposed that he should fasten a rope to its tail, and then make one of the elephants haul it out. He accordingly proceeded to carry out his plan, which was more easily conceived than executed; for on his attempting to slip a noose over the tail, the creature gave it a violent and an unexpected wag, which somewhat disconcerted his arrangements and startled him considerably. At length, however, after repeated failures, which elicited many jocular remarks from his comrades, he succeeded in making fast the noose. Having tied the other end of the rope to one of the elephant's pads, we gave the word to pull, when away went the elephant, dragging after it the saurian, which now, having seemingly recovered its wits, was struggling frantically, and making abortive attempts to turn round and seize the rope between the well-armed jaws it kept snapping together with a loud noise. The creature was hauled on to an open spot, and finished

with a bullet through the head. It was one of the "muggur" or broad-snouted kind (*Crocodilus palustris*), and measured 7 or 8 feet long.

Pythons of very large size were sometimes met with in these jungles, and I have myself shot several, one of which measured over 21 feet in length, and in girth about 2 feet. For the benefit of such as are fond of the marvellous, I shall venture to here recapitulate the strange circumstances attending the slaying of this huge reptile, as contributed by me years ago to the 'Oriental Sporting Magazine.' But those who, from their inexperience of wild-jungle life, are always inclined to be sceptical regarding "travellers' tales," had better skip the rest of this chapter, for I warn them that the unvarnished facts it contains will almost require the powers of deglutition of the creature in question to swallow. Nevertheless they occurred exactly as follows.

I was out in camp in the eastern Doon with a party of my regiment employed in cutting grass for barrack-thatching, when one day I chanced to notice that one of the men at work had adorned his head with a curious-looking turban. A closer inspection showed it to be a portion of a huge python's semi-transparent cast-off skin, which the lad, a light-hearted Goorkha, had thus donned, much to the amusement of an admiring circle of his broad-faced companions, who were regarding him with looks beaming with fun. On questioning him as to where he got it, he told me he had picked it up when out shooting in the neighbouring forest, and that he had seen, close to the place where he had found it, what must have been the snake that had shed it, as the creature lay basking near the entrance to a big hole, into which it had disappeared at his approach. As he said he thought he could remember the spot, I proposed that he should proceed there forthwith.

For a long way my sturdy little guide trudged silently ahead through the forest, until at length he appeared to be drawing up to something, after the manner of a pointer on

an uncertain scent, as he "gingerly" (excuse the slang, as being the most expressive term for the movement) advanced each bare foot through the long dry grass. Presently he motioned to me to stand still whilst he proceeded cautiously to climb a small tree, in order to get a better view of the ground in front of him. After a careful survey, he beckoned me to advance. Just as I reached the tree, a dark-brown object, which I recognised at once as a big snake, glided across a bare patch of ground about fifteen or twenty yards in front. In a few seconds the reptile was helplessly writhing and twisting in its death-throes, with a bullet through the thickest part of its body.

I now considered that I had secured the original wearer of the cast-off skin, and that the business was at an end. But the Goorkha positively asserted that this snake was not the one he had seen before, which he declared was nearly twice as large, and of a much brighter colour. This python was 13 feet long and about a foot and a half in girth, with dark-brown and black markings.

We now went to examine the hole, which was close by, and for which the snake must have been making when I stopped him. It had evidently been originally the den of porcupines, though now used as the temporary abode of snakes. Of its being the latter there was no doubt, for on looking into it we could see a bit of the tail-end of a second snake, which doubtless was the one the Goorkha had at first seen. We resolved not to meddle with it then, as we thought it would be pretty sure to be found basking in the sun some other day. We dragged the other to the nearest forest-path and suspended it over a branch, where it could be easily seen by the men sent with an elephant to fetch it. Its body showed slight muscular action when brought to camp in the evening some six hours after being shot.

Business prevented my visiting the python's haunt next day. On the following morning, however, I went there with three Goorkhas who volunteered to accompany me. Cau-

tiously we stole up to the place in hopes of finding the snake out sunning itself. But it was nowhere visible, so we proceeded to inspect the hole, and there found the creature's tail in almost exactly the same position as before. As no one seemed inclined to handle the tail, we poked at it with a stick, when it was merely shrunk a little farther into the hole. A fire was lit at the entrance and the smoke fanned into the hole, without the slightest apparent effect on the snake. Finding all our endeavours to rouse it fail, I sent one of the Goorkhas back to camp to fetch some tools with which to try and dig it out, and also an elephant for carrying the creature if we succeeded in our attempt to unearth it.

Meanwhile the other two men and I set to work by turns to enlarge the mouth of the hole with sticks, cut and sharpened to a point by the Goorkhas with their kookeries. From the ground being very hard, and the sticks having constantly to be resharpened, our progress was rather slow. After digging and scraping away for a long time, we had enlarged the mouth of the hole enough to admit sufficient light to enable us, by stooping and peering into the gloom of the interior, to see some of the reptile's huge coils, which looked as thick as, if not thicker than, a man's thigh. It was an enormous python, and we were surprised to find that it did not as yet evince the slightest signs of resenting our intrusion, although the creature must have been quite conscious of it; for we fancied we saw its eyes regarding us, as it lay with its great flat head resting on one of its coils.

Supposing the snake to be in a half-torpid state, we determined to try and draw it. We all three, therefore, proceeded—somewhat nervously I must own—to lay hold of its tail. To this familiarity it showed its objection by a decided inclination to wag its caudal extremity, which had such an electrical effect on our nerves that we dropped it like a hot potato, and—what shall I call it?—retired. It must have been very sleepy indeed, for immediately on its tail being released it desisted from moving it. This restored

confidence, and again and again did we renew our futile attempts to haul it out. We had yet to learn the mighty muscular power of the creature, which had now withdrawn some of its coils farther back into the den, thereby giving them additional purchase. We had, however, so far succeeded, that several feet of its length were now exposed to view.

A shot would in all probability have induced it to relinquish its hold. But had I fired at random into the hole, I must have torn and disfigured its beautiful new coat (it was evidently the original owner of the cast-off one), which I wished if possible to secure uninjured as a specimen; and a wound near the tail might not have altogether disabled it. I therefore refrained from shooting until a more favourable opportunity should offer.

We continued to dig and scrape with our sticks and hands at the hole—our operations being sometimes interrupted by the startling presence of the creature's head, which it occasionally poked towards the entrance; and from the lively manner in which it kept darting out its little forked tongue, it seemed to be gradually awakening to a sense of its impending danger. It still, strange to say, allowed the few feet of its tail we had managed to expose to lie outside the hole—a fact for which I cannot account, except by supposing the snake to have been too sluggish to withdraw it.

At last the elephant and tools arrived, when a bright idea struck us,—we might draw it out with the elephant! Sufficient rope for the purpose was loosened from the elephant's pad. This rope, which was made of cotton, and about the thickness of a man's thumb, was hitched round the snake's tail, and its remaining length brought up again to the pad and fastened there, thus doubling its strength.

Now came the tug of war! A sudden jerk might have torn the skin; the mahout was therefore warned to put on the strain gradually. Little did we know what a tough and an obstinate customer we had to deal with. Tighter and

tighter grew the ropes, when "crack" went one of them. Still the strain was increased, until again "crack"—the other had snapped also, leaving the snake *in statu quo*.

We were now at our wits' end as to how we should proceed to dislodge the creature without injuring its skin by shooting into the hole. After a short consultation and an inspection of the surrounding ground, we came to the conclusion that before resorting to this last resource there still remained one chance.

Situated on the other side of the den, and pretty close to it, was the abrupt extremity of a small ravine. By countermining from this we might be able to attack the place in rear. We accordingly turned to once more at our excavating operations, which were now more rapid and easy from our having proper tools to work with. Our perseverance was rewarded by finding that we had luckily hit off the right direction from the ravine, and we had soon succeeded in boring a hole large enough to be able to stir up the creature with a long stick. The snake, finding itself assailed both in front and rear, and that its stronghold was becoming too hot for it, now began to show symptoms of an inclination to quit it. I therefore, with one of the Goorkhas, took up a position that commanded the front door of the den, leaving the other two to watch the back.

The business was now becoming decidedly exciting. My jolly little companions were getting quite wild with delight, and were carrying on a hurried altercation, in their own peculiar dialect, as to which way the creature intended making its exit.

"He's coming out on this side," shouts one of them from the ravine. "He's not going out on your side, for here's his head coming *our way*," argues the lad beside me. "Why, *we* can see his head *here!*" comes the reply from the others, half frantic with excitement. "Then there must be *two* of them," exclaimed my fellow, jumping up in a transport of glee at the idea.

Such, indeed, proved to be the case. There was undoubtedly a second monster in the den, and almost as large a one as the first. As the snake on our side now thrust out its head several feet, and was swaying it to and fro as if it meditated bolting (not my carcass, by any means, but its own) from its lair, I retreated a few paces and planted a charge of buckshot in it, about two feet behind the head. This at once doubled it up, literally, without much damaging its coat.

The scrimmage in the den, a portion of the interior of which we could now see tolerably plainly, was tremendous, as the huge coils of the stricken python, in its death-struggles, became entangled, as it were, with those of its living companion. The latter, however, showed a decided disinclination to quit its dwelling, where it remained screwing itself about, seemingly in a great state of alarm, and seeking safety from danger, like the "ostrich of the sandy desert," by attempting to hide its head. After just securing such a fine specimen of the serpent family, killing this apparently harmless member of it also would have been wanton butchery.

When the violent contortions of the dying monster had somewhat subsided, we hauled it out and hoisted it on to the elephant, not, however, without some trouble from its enormous weight, and the excessive slipperiness of its smooth skin. We left the remaining python in undisputed possession of its now lonely abode, from which it still seemed loath to depart. A Goorkha, when out with his gun a day or two after, came across it in the jungle not far from its old haunt, and being unaware of my merciful intentions towards the creature, shot it and brought it to me as a grand trophy.

I have already given the dimensions of the large one as it lay unstretched. It was beautifully and brightly marked with yellow and black. It is now a cleverly executed specimen of taxidermy by the late H. Ward of Vere Street, and forms a prominent if not a very elegant addition to my small collection of shikar trophies.

My own experience of Indian pythons is, that they are not the fierce, bone-crushing creatures they are commonly thought to be, at any rate with regard to human beings. Indeed, from what information I have been able to gather concerning them, they appear to be quite harmless; their prey chiefly consisting of birds, hares, fawns, and "suchlike small deer." But I never have come across them during the hot season, when they may possibly be more lively. In winter they always seemed to be timid, and usually sluggish, on being disturbed. This may account for our being able to play such pranks with them as we did with impunity.

From this diversion let us hark back to the *putteyr* swamp. This time when beating through it we saw neither tiger nor reptile; nothing but some hog-deer (*Axis porcinus*), called "pārāh" or "dhōter" by the natives—an animal about the size of a roe-deer, and not unlike it in its grey winter coat. The buck carries pretty horns, averaging about 14 inches long, with two short upper tines on each horn, and one brow-antler, also short and pointing upwards. This deer usually frequents open tracts of long grass and marshy ground, and is very plentiful in the Terai and Dehra Doon. It affords capital shooting from elephant-back, after the jungle conflagrations in spring, when it can be beaten out into the open from the unburnt patches of long grass. As the shots are almost invariably running ones, it requires sharp and pretty shooting with the rifle to hit such a small mark.

The spotted deer (*Axis maculatus*), or cheetal, is very common in the same localities—in fact in almost all Indian forests, from the base of the Himalayas to the sea-coast. It affects thick cover in the forests, or tracts of long grass in their immediate vicinity. In height it stands about 3 feet at the shoulder. Its colour somewhat resembles that of the fallow-deer, but the white spots are more clearly defined, and on a darker ground. The ordinary length of its fully developed horns is about 30 inches. They have a

very graceful sweep, with three regular tines on each horn, and sometimes an extra snag or two beside the brow-antlers. The longest pair I ever got were 37 inches before I peeled off the velvet with which they were covered, and as the tips were quite soft, they would probably have grown another inch. The span was 30 inches, and 4 inches the circumference of beam clear of velvet. They seldom, I think, grow much longer than this, although sometimes slightly thicker. Spotted deer appear to have no regular time for shedding their horns. I have noted in my shooting-journal having killed them in January with horns fully developed, but in velvet. I also find one as having been shot with horns in exactly the same state in April; and I shot one on 26th February—a date, be it observed, about midway between the above two—carrying long and perfectly clear horns with well-polished white tips. Another killed in August had horns which, from their worn and smooth appearance, were quite ready to be shed. Of two stags I killed, right and left, in the month of March, one had long clear horns with well-worn points, whilst those of the other were in velvet and only half-grown. I could mention many other instances tending to show the strange irregularity with which this deer doffs its antlers. In the months of March and April, however, I found the horns generally best developed. The cheetal stag is termed by the natives a “jhānk,” as are likewise the males carrying horns of all the deer tribe.

The little four-horned antelope (*Tetraceros quadricornis*), or “chousinghia” as it is called, is met with in much the same sort of country, but rather sparsely, and usually singly or in pairs. It is rather lighter in colour than the hog-deer, and about the same size, but it seldom or never frequents marshy ground. It is frequently found among bush jungle or near the outskirts of forests. The front horns seldom grow longer than an inch, and are more often mere nobs. The hinder ones are about 3 or 4 inches long, and some-

times even more. They are quite smooth, except a ring or two at the base, and very slightly curved forward.

The swamp-deer (*Rucervus Davvancellii*), called "goen" by the natives, which is plentiful in the open grassy swamps of some parts of the Terai, is said to be occasionally met with in the Dehra Doon; but much as I have hunted there, I have never seen it in that locality. It is nearly the same size as the jurrow, but paler in colour. It carries fine horns, branching well forward, with many points along the upper part of the beam, but only one brow-antler on each horn. In shape and paleness of colour the horns somewhat resemble those of the Virginian and the black-tailed deer of North America, but the goen's horns grow considerably longer. This deer is never found on the mountains, and seldom in thick forest, although generally on its outskirts. A sketch of an exceptionally fine pair of horns of a swamp-deer killed in the Oude Terai will be found at the end of the last chapter.

CHAPTER XI.

AFTER a Sunday rest in camp, the following morning we made an early start, our intention being to ford the Ganges and beat up some swampy cane-brakes on the farther side of it. As we moved leisurely on the elephants towards the ford, which was a mile or so distant, I diverged into a "null" jungle, along the edge of which we were skirting, in the hope of getting a shot at some jungle-fowl I heard crowing there. "Null" or "nurkul" is a long reed-like grass, common in the Terai and Doon jungles. It is generally a sure harbour for game of all sorts and sizes. I have frequently seen these reeds growing so tall, that, when standing in the howdah, I was unable to reach their tops with my gun held up at arm's-length. Even an elephant looks comparatively small in a null jungle.

Well, my elephant had not got far into the null when I heard a deep angry growl, which was immediately followed by the shouting of men, evidently in a state of alarm. Pushing on to the place from whence the sounds came, I found two natives "treed," and hallooing away at the top of their voices. They said they were collecting wild honey, when they had suddenly come on a tigress and two cubs, and had at once climbed up the nearest tree. This information was not easily elicited from them, for they seemed to be as much frightened at the sudden appearance of the elephant as of the tigress.

I lost no time in getting back to inform the rest of the

party, when we commenced a regular and careful beat round about the place where the tigress had been seen. But notwithstanding some of the elephants showing the usual and unmistakable signs of a tiger's proximity—in acknowledging the scent by smartly tapping the ground with their trunks, from which they at the same time emitted a peculiar metallic sound—and the noisy commotion among the jungle-fowl, and a troop of monkeys that were chattering and gibbering away as they swung themselves from branch to branch in the trees, which also betokened the presence of Madam Stripes in the vicinity, we failed to find her. The jungle was so thick and tangled that our progress was necessarily very slow, which delay she had evidently taken advantage of to slink away.

All hope of finding the tigress being at an end, we proceeded to cross the Ganges where it was fordable by the elephants, and commenced beating up the cane-brakes, or "bent jungles" as they are commonly called. The canes in these brakes have a remarkably beautiful appearance, growing in widespread tangled masses, or trailing in graceful festoons from the trees, their glossy dark-green fronds resembling drooping plumes of feathers. But of all bad ground for a line of elephants to get over, commend me to a bent jungle as being the worst. The canes are so closely interwoven, and so covered with strong hooked thorns, and the places they grow in are so soft and swampy, that it is sometimes quite impossible for an elephant to force its way through them. For dislodging tigers from such spots, a kind of firework called *anār*, which makes a deal of noise and smoke, is used. But even this often fails to drive them fairly out of these sanctuaries, in which they are very fond of lying up during the intense heat of the day.

It has been said that of the risks run in tiger-shooting from elephants, the danger from the tiger itself is the smallest. This is a matter of opinion. But there is no doubt about there being other dangers quite as great attend-

ing this sport—that from a timid elephant being about the worst; for if an animal of this kind gets thoroughly terrified and bolts among tree jungle, the consequences are likely to be disastrous. I once had my howdah and one of my guns smashed to bits by a runaway brute of this sort. Fortunately I was not in the howdah at the time.

A source of constant danger with us on this trip was a vicious "mukna" (tuskless male) elephant. The brute had already killed two men, and nobody but his mahout dared approach him. Whenever any of us had occasion to dismount from our elephants, the first question was always as to the whereabouts in the line of Moula Buksh, as our dangerous friend was named.

Getting badly bogged in a "fussand," as the natives call a quaking morass, ranks about next in order. And an incident that occurred in this day's beat will serve to show what it means.

We had been beating slowly and with difficulty through the patches of bent jungle, and plying the more inaccessible spots with *anārs*, without having seen a sign of a striped jacket, when, on reaching a more than usually swampy place, Golab Soondrie (*Anglicè*, Beautiful Rose), the steady old elephant I was on, showed a decided disinclination to entering it. Not wishing to leave my place in the line, I made the mahout urge her forward, and she had not taken more than a few steps when she was floundering about up to her middle in thick black mud and water. The old lady finding she had got fairly into it, continued to struggle bravely on towards some firmer-looking ground a short distance in front. But ere reaching this her body was almost entirely submerged in the foul inky fluid, in which she rolled about like a dismayed ship in a heavy sea. It was impossible to leave the howdah on account of the depth of water; and in such cases, even when the ground is stable enough to admit of dismounting, it has to be done with caution: for an elephant, on finding itself in a fix of this kind, is said to be

apt to lay hold with its trunk of anything within reach, without respect even to persons, to place under its feet for support. And the usual method adopted, when everything else fails, for extricating an elephant from a "fussand" (swamp or quicksand), is to throw branches of trees, bundles of grass, &c., within its reach. These the sagacious beast forces down with its trunk under its feet, until the footing thus made becomes tolerably firm.

At length, by dint of great perseverance and exertion on the part of Golab Soondrie, she reached the edge of this abominable quagmire, and having managed to get her fore-feet up on to some firmer-looking ground, was with difficulty dragging out her hind-quarters, when to my consternation the rotten bank gave way under her weight. Back she slid into the horrible slough almost perpendicularly—so much so that the guns lying in their sloping positions alongside me in the howdah fell back on to my outstretched arms, as I clutched the side-rails for support, and I for the moment feared she was going to roll completely over. Matters now looked serious; for the "kawās" (back partition) of the howdah was quite under water, and the black muddy fluid reached half-way up to my knees in the fore-part of it. The mahout was obliged to quit his seat on the neck of the elephant, and little else was to be seen of the animal save the top of her head and her trunk. Still the fine old creature continued to make the most prodigious efforts, until at last, thanks to her being a small and an active elephant, she managed to scramble out. Before we overtook the rest of the party—who, from the thickness of the jungle, had not seen our mishap—they had almost reached the tents, which were near at hand, when the dirty plight we presented after our mud-larking adventure afforded much merriment at our expense.

Finding there was no fresh "kubber" (intelligence) of tigers in this vicinity, we next day had a beat for game in general, of which the pads showed a fair amount, when, to-

wards evening, we reforded the river on the elephants. As we were passing some grass-sheds on our way to camp, Moula Buksh displayed his evil disposition by chevying a wretched pony, which was heavily handicapped in the chase by being hobbled. All the forcible persuasions of the mahout with his iron-hooked goad failed to stop him as he went straight for the pony. Just as his uplifted trunk was over his intended victim's back, the mahout, as a last resource, dropped his outspread turban down over the brute's eyes, and so saved the pony from being kicked to a jelly; for an enraged elephant generally vents its spleen on anything it considers obnoxious and can get hold of, by making a shuttlecock of it between its fore and hind feet. I once saw a Goorkha, who was out with us, have a wonderfully narrow escape from being thus kicked to death. A cheetal had with difficulty been padded on a timid unsteady elephant, which suddenly getting frightened at the dead animal's horns, which were dangling over the pad, touching her hind-quarters, began violently shaking her huge body with a view to getting rid of the objectionable load. This she succeeded in doing, as well as of the Goorkha, who was also on the pad. Before the man could regain his legs the elephant was on him, and playing football with his body. Fortunately the mahout soon managed to control the brute, though not before the man was left lying apparently lifeless. We were horror-struck, thinking the poor fellow was dead. Although he was terribly shaken and bruised, and the breath knocked completely out of him, strange to say not a bone was broken, nor was he otherwise very seriously damaged.

Although this visit to the eastern side of the Ganges was not attended with any unusual success, on a former one to the same locality, through the kindness of Major Baugh, who was then superintendent of the Government Elephant "Khedda" (Catching Establishment) in the Kumaon Terai, and whose camp we came across, our shooting-party enjoyed an exciting day's sport, the like of which it has seldom been

my good fortune to witness. I may here transcribe my account of it, written long ago for the 'Oriental Sporting Magazine.'

There are several methods resorted to for capturing wild elephants in different parts of India. These have been so ably described by those who are much more conversant with such experiences than I am, that I shall therefore only premise my attempt to recount the incidents of an elephant-hunt witnessed by myself, by mentioning that the way the animals were usually captured in the Kumaon Terai was by driving them up from the level forest into some narrow mountain-gorge, or *sote* as it is there called, the ridges on either side of which having been previously lined with men provided with firearms and blank ammunition, in order to prevent the elephants making their escape on either flank.

On the wild herd being driven into this kind of *cul de sac*—an operation which was not achieved without considerable tact and manœuvring—the entrance was guarded by some of the largest and strongest male elephants being posted across it; whilst other animals carrying the "phandetes" (noosers) were ridden in among the herd, and the process of noosing and tying commenced. This was very cleverly executed by men trained to the work, assisted by the great sagacity of the tame elephants. Before it could be effected, however, it was occasionally necessary to subdue some mighty lord of the herd by pitting a domesticated giant against him, when a terrific combat sometimes ensued between these elephantine gladiators, which usually resulted in the discomfiture and eventual capture of the wild animal.

Intelligence of the proximity of a herd of wild elephants having just been brought in to the superintendent by his scouts, he at once prepared to go after it, and invited our party to join in the sport.

The necessary arrangements having been quickly made and orders given, each of us mounted an elephant, and seated himself on a very small pad that had been substituted for

the usual large-sized one, as being less likely to get displaced when moving quickly through tree jungle. A rifle or gun was carried across the knees, but only to be used for defence in the event of a charge being made by a wild elephant.

As the Khedda camp was on the west bank of the Ganges, and the herd was reported to be on the opposite side, we at once proceeded to cross the river by the nearest ford. A truly fine sight it was to see some thirty elephants steadily ploughing their way through the water, which was running almost up to the pads, as the animals leant their huge bodies against the stream to resist the force of the rapid current.

All having got across the river, the first thing necessary before starting in pursuit was to carefully reconnoitre the exact position of the herd. This was done on foot by a few of the party, when it was ascertained that the animals were feeding among some thick clumps of bamboos, which were situated on so seemingly impracticable a position for elephants to reach, that it was difficult to conceive how such huge beasts ever got there; but it is almost incredible what steep and difficult places elephants can travel over. As the ground was found to be unsuitable for attempting to capture the animals by driving them up into a *sote*, Major Baugh's intention was, in this instance, merely to endeavour to drive them towards a more likely locality for circumventing them. At the same time, it was just possible that one or more of them might be noosed in the chase; at all events, he expected an exciting run.

The reconnoitring party having remounted their elephants, we all advanced slowly, and as silently as possible, towards the herd, which, apparently not as yet being much alarmed at the approach of the tame elephants, moved leisurely down through the jungle on the steep declivities towards the level forest below. Our progress was at first rather slow, our elephants using the greatest caution, whilst descending, in placing one foot firmly before venturing to move another.

However, we at length reached more level ground, where we soon overhauled the wild herd, and a most exciting chase now commenced.

Immediately on viewing the animals, as some seven or eight of various sizes broke away about twenty yards in front from among some tall "nurkul" reeds, the phan-detes shot ahead, balancing themselves, half standing, half kneeling, on their little pads, with nooses held ready to cast should they succeed in getting their elephants, which were being hustled along at a most astonishing pace for such unwieldy animals, alongside the wild ones. The latter, now becoming alarmed, began to increase their speed, though not even now to its full extent, from there being amongst them one or two calves whose retreat their mothers were anxiously endeavouring to cover, sometimes shuffling along half sideways as they tried to look back at their pursuers, who were gradually drawing nearer and nearer.

The wild excitement of the pursuit now reached its highest pitch. Our elephants, in addition to being driven half frantic from being urged along by the mahouts freely using their iron goads, and by their assistant "char khat-tas" (forage-cutters), who, as they clung on behind the little pads with one hand, with the other pummelled the poor animals most unmercifully in rear with short, heavy wooden clubs studded with a few iron spikes, had also become imbued with the general excitement, and had got their blood fairly up as they dashed ahead regardless of every obstacle.

Onward we go, and still onward, scrambling over prostrate trunks of trees, through dense underwood, thorny brakes, and tangled creepers, which snap like pack-threads before our elephants. Now we are bowling along across an open grassy glade, or rattling over the loose boulders in the dry bed of a water-course. Again we charge headlong into the forest, which resounds with the crashing of boughs and

dry nurkul reeds—the shrill trumpeting and snorting of the elephants being mingled with the sharp ejaculations of encouragement or abuse of their beasts from the mahouts, as they vie with each other in their endeavours to keep the wild herd in view. We have plenty to do in perpetually ducking our heads and bending our bodies to avoid projecting branches.

There goes the first fall ! An excited Goorkha is swept clean off the pad of an elephant near me by a tough creeper catching him across the middle, sending him sprawling among the bushes. There is no stopping to pick him up, but I glance back and see him on his legs again, he fortunately having fallen on a soft place. Now we are rolling and floundering through a quaking bog, from the black tenacious mud of which the elephants slowly and with difficulty drag their feet with a succession of squelchy sucking sounds. This causes a temporary check, and gives the fallen Goorkha time to scramble up on to his elephant, an acrobatic feat he accomplishes with the assistance of the animal's tail. But we are soon clear of the swamp, and still on and on we tear helter-skelter. How we, who are unaccustomed to such work, contrive to stick on to our small pads, and also to balance a gun across our knees, seems perfectly miraculous ; but one does things in hot blood that one never dreams of being able to do in cold.

At last a nooser has managed to lay his elephant alongside the hindermost wild one. She appears only to see the elephant and not its rider, who, with ready noose, eagerly awaits a favourable opportunity for casting it ; consequently she is unaware of her real danger until she feels the rope on her head. But now, with a shrill trumpet, she shoots swiftly on, slipping away from under the noose with a lift of her trunk and a toss of her head. Still her maternal solicitude causes her again to check her speed, for her offspring is beside her, and the phandete is once more up with her, and makes another unsuccessful attempt to noose her.

But the pace has been too severe to last, and some of our elephants are showing decided symptoms that such is the case, by beginning to tail off. As they come straggling back in groups from the chase, their excited riders have each some wonderful tale of their prowess during the scrimmage to relate, which they do with much gesticulation and true oriental volubility.

Although Golab Soondrie, the elephant I rode, from formerly having been used in the elephant-catching line, was well acquainted with the business on hand, she could not keep pace with the noosers' elephants, which were of course in a high state of training and condition for such work, from constant practice. I was therefore unable to be in quite at the finish, which resulted in the capture of one of the calves only—its mother, after baffling all attempts to noose her, having at length left it to its fate. The poor little creature, which was scarcely bigger than a pony, was set at liberty, as it was considered too young to be weaned from its mother.

The original intention of driving the herd towards a more practicable locality for their capture having been effectually carried out, we recrossed the Ganges as the shades of evening were closing around; and this glorious day's sport was wound up by a champagne dinner given by the Khedda superintendent, over whose hospitable board the exciting incidents of the hunt were recounted and discussed.

The piteous cries of the little calf in search of its dam, as they were borne across the river on the night breeze, and the frequent low rumbling noises made by the still excited tame elephants at their pickets, were the last sounds I heard ere I fell asleep.

Next morning Major Baugh took us round his Khedda. One or two of the more recent captures were bound fast by their legs to trees, where they rocked themselves impatiently to and fro, resisting all the blandishments of their attendants. By way of accustoming them to the human presence and voice, they were periodically stroked and brushed down

with long green boughs, the men performing this office the while singing songs and talking to them. One magnificent tusker named Scott attracted much of our attention. Although now the principal gladiator of the Khedda, he had not been very long in captivity, and still retained the proud free gait and high carriage of head of his wild state. Major Baugh told us his behaviour before tigers was splendidly steady, and that on one occasion when a tiger had attempted to charge him, he had actually lifted the brute with his trunk and sent it spinning up for yards through the air.

The sagacity, and even enjoyment, which the domesticated elephants evince in assisting at the capture of their wild brethren is truly remarkable, and the more so, as many of the tame ones may themselves have been roaming free in the forest only a few months before. For example, it is customary, on a wild elephant being captured, to conduct it along to camp, or to lead it from one camping-ground to another, attached by strong ropes to a Khedda elephant on each side of it. These two warders hustle and jostle their prisoner along, and should he show signs of becoming obstreperous, belabour him with iron chains, which they carry with their trunks for this purpose. The captive, however, generally submits rather peaceably to his fate, and soon becomes quite tractable to the will of his two custodians.

But to revert to our present doings on the banks of the Ganges. The day after recrossing the river we were again beating up the quarters of the tigress and cubs, when suddenly there was a cry of "Mukkee aya!" (the bees have come). Those who have never hunted in the Doon or Terai forests can hardly imagine the startling effect this simple exclamation sometimes has on a line of elephants. And perhaps this will be best understood by relating what occurred in our case on hearing it.

In breaking through the underwood somebody had inadvertently disturbed a swarm of bees, which in these

jungles suspend their combs from a branch, and often so low down that, if the nest is hidden by foliage, an elephant is very apt to run foul of it. This had in all probability happened in the present instance, for the infuriated insects

Wild bees' nest.

attacked both man and beast with such determined pertinacity, that the result was a case of *sauve qui peut*, causing the total disorganisation of the whole beat. Tigress and cubs were at once forgotten as the line scattered hither and thither in futile attempts to escape from the bees, which followed

some of the elephants in clouds, plying their stings so viciously as to even leave many of them sticking in the leather that covered the iron rails of the howdahs. Strange to say, these bees, when thus disturbed, seem to devote their attention chiefly to certain elephants, and these they will follow for miles, only attacking the rest of the line occasionally and in small detachments. In this case the principal object of their animosity was the Colonel's elephant, which, though steady enough before a tiger, was quite unable to withstand this combined attack of little enemies. With a shriek of pain, she set off, tail on end, until pulled up by a tangled thicket of the huge "maljoon" creeper, into which she charged headlong, in the vain hope of eluding her persecutors.

Being on the extreme left of the line, with the help of a blanket and plenty of smoke, created by the Goorkha behind me in the howdah burning bits of rag torn from his turban,

we managed almost to defy the more mild assaults made on our elephant.

On getting clear of the heavy jungle in which the bees had been disturbed, some sort of order was re-established, although many of them pertinaciously stuck to us, and we did not get entirely rid of the angry swarm for a long time. Notwithstanding each of us being provided with a blanket, which is usually kept ready for wrapping about one's head in an emergency of this sort, there was a visible change in the features of some of the party when we came to compare notes after our disorderly retreat.

But the excitement of this day's beat was not to end with the departure of the bees, for we had hardly got quit of them when a sound was heard, and not very far off either, that caused us all to prick up our ears. It was the deep guttural growl of a tiger, which, judging from the angry tone of its voice, was in a contumacious humour.

On we all push in line towards the spot from whence the sound had proceeded. Before reaching it, an unexpected obstacle occurs in the shape of a deep narrow nullah, with precipitous banks, and almost hidden by the long grass growing on both sides of it. Whilst I am pondering in my mind as to what could have induced the tiger to betray its whereabouts in this unusual manner, Golab Soondrie has been making a path for herself by breaking down the steep bank with her feet, and her fore-quarters are now in the nullah, the top of her head being about level with the opposite bank, when, with a succession of furious hoarse grunts, a big striped object comes rushing through the grass towards us. I only catch a glimpse of the charging brute, and cannot shoot, as the elephant, from being so much taken by surprise at this sudden and unprovoked attack, wheels sharply round with a jerk that is almost enough to send me out of the howdah. Quick as thought, Golab Soondrie has her fore-legs up the bank again, and our position becomes rather critical, for her hind-quarters are now in the nullah,

and the howdah is on a level with the charging tiger. On comes the beast with a spring from the bank, just missing the back rail of the howdah, and falling with a splash into the shallow water in the nullah. The Goorkha in the kawas behind me scrambles over into my part of the howdah, to the side-rail of which the mahout is already clinging, he having jumped up from the elephant's neck at the first sign of danger. Altogether there is such a general scrimmage, and my hands are so fully employed in holding on to the howdah-rails, that it is impossible to handle a rifle ere the baffled tiger has slunk off and disappeared along the bottom of the nullah.

The bold behaviour of this animal was, under the circumstances, decidedly unusual; for an unwounded tiger, when disturbed, generally tries to steal off, if possible, unobserved, and seldom attacks a human being unless provoked. Even man-eaters, of which the proportion is fortunately very small, resort to the most cunning and sneaking methods for securing their victims. A female, with cubs, however, is often an exception to this rule, and such our friend might have been, though in this instance we failed to find her offspring.

A general *battue* next day brought this short hunting-trip in the Dehra Doon to a close. Although not so successful a one as regards the actual slaying of tigers as others I might have told of, it is perhaps better calculated to afford a fair idea of the general sport that was then to be had in that locality, and also to show what chance work it is finding these cunning and wary brutes in such heavy jungles, unless certain intelligence of their whereabouts near a fresh "kill" has first been obtained. Moreover, my experiences of tiger-shooting are comparatively few, and in thrilling adventure they fall so far short of those which have oftentimes been graphically recounted by more practised hands at this noble sport, that any further narration of them would only be superfluous in a book which is more intended for describing mountain work.

CHAPTER XII.

ON the outer ranges and spurs of the Himalayas rising abruptly from the Dehra Doon, the "surrow" (*Nemorhædus bubalina*), which is nowhere very common, was not unfrequently met with. This curious animal, which, like the gooral of the Himalayas and the chamois of Europe, is one of the links between the antelope and wild goat, might almost be supposed to have a strain of the donkey as well, for it has a decidedly asinine appearance, particularly about the head. It stands about three feet at the shoulder, which is an inch or two higher than the croup; and its build is so sturdy as almost to make its form look ungainly and its gait clumsy. The neck is thick, short, and black, and is surmounted with a bristling mane of coarse black hair extending back over the withers, which, with its almost black head and large mule-like ears, grey muzzle, short black horns, and dark fiery eyes, give this beast a fierce look which its character does not belie. Its general colour is a very dark kind of roan-grey, intermixed with black; black dorsal stripe, and tail which is very short; flanks and fore-quarters reddish-brown, creamy-white from above the knees and hocks downwards; horns black, round, slightly curved, sharply pointed, sloping well backward, and roughly annulated for two-thirds of their length, which is ordinarily about 9 or 10 inches, with a circumference at the base of 5 or 6 inches; ears about 8 inches long; distinct but not very large eyepits, from which, I re-

member in one at any rate of the specimens I shot, a whitish-looking discharge rather freely exuded. The surrow is pretty generally, though sparsely, distributed over the whole length of the Himalayan ranges, and from the higher to the outer ones. Its favourite haunts are the wildest of craggy, precipitous, wooded gorges where dense "ringal" (a kind of long, thin, reed-like bamboo) jungle abounds, in the deep, gloomy recesses of which it usually lies up during the day, seldom venturing abroad except in the very early morning and late in the evening to feed, and then usually only a short distance from its sequestered retreat. For it is of very shy habit, although its disposition is so bold that it is always ready to show fight when wounded, or even in defence of its wounded mate, with which, as well as with their offspring, sometimes it is found in company, though generally a solitary animal. Of its courage the following I know to be an authentic instance. A female surrow had been shot by a sportsman, when, on his native follower approaching to secure it, a male companion rushed out from the dense cover hard by, and going for the man, sent him rolling down-hill with a butt from its horns, making good its retreat ere the astonished shooter had time to remonstrate with his rifle. The doe is very similar in size and appearance to the buck, with horns of almost the same length and thickness. Its cry of alarm resembles a kind of sharp shriek, which, like the gooral, it emits at short and regular intervals. When suddenly surprised it sometimes shows a strange amount of stupidity. I have known it stand stock-still at gaze, even after being shot at, if missed. But once started it rushes off headlong regardless of every obstacle in the shape of rough precipitous ground, seldom stopping to look back. Its ordure, like that of the musk-deer, is generally found deposited together in large heaps. In the Kumaon district, and also, I believe, in Nepal, it is called "tāhr" or "thār"; the *tāhr* proper being there called "jhārrel." On the more

eastern Himalayas a red-coloured variety of the surrow occurs, but even more sparsely, I am told, than its darker-skinned relative of the more western ranges.

In one of my many shikar trips among the mountains adjacent to Dehra Doon, I was exceptionally fortunate in coming across several of these rather uncommon nondescript animals. On this short excursion I started with a brother officer who, although not a sportsman, was an ardent admirer of nature. Our objective point was a singularly shaped craggy hill, called Gopee Chund *teeba* (hill), which formed a prominent feature of the outer ranges where it was situated.

Amongst the native folk-lore of this locality were many wild legends concerning this hill. It was said to have derived its name from a rajah of bygone days, who, with his boon companions of his court, used to carry on their revels and midnight orgies in his palatial halls, which were supposed to have once stood on the site of the bare grey crags and high cliffs formed by landslips, where the eagle now has its eyrie and the goral roams free. But Rajah Gopee Chund having suddenly been stricken with remorse for his past vices and follies, resolved to become a *joyee* (religious devotee) for the rest of his days. On his turning *joyee* it appeared that he must in some mysterious manner have acquired supernatural powers, as prior to setting out on his lifelong pilgrimage he converted his castle and all its belongings into the rugged grey rocks that now form the hill.

By the natives it was supposed that the game on Gopee Chund hill bore charmed lives. Indeed I had almost reason for fancying that such was the case; for, plentiful as game was there, never before, when going over it, had I been able to shoot a single head. This time, however, I succeeded in breaking the spell by making two such wonderful shots, or flukes, and under circumstances so peculiar, that it seemed as though the spirit of the *quondam* rajah had transferred

the favour hitherto conferred on the wild denizens of the hill to me.

We had reached the spot where we intended to encamp, which was a small saddle-like flat connecting Gopee Chund with another hill, and commanding a view of a mighty precipice that extended almost from summit to base of the former on almost a sheer wall of nearly 1000 feet high—the scene of a recent landslip. We were resting among some rocks awaiting the arrival of the men who were following us up the steep track with our traps, when I chanced to notice two brown objects moving among the crags above the precipice. They were so high above us, and in the distance looked so small, that we at first thought they were monkeys, as also did some of our sharp-eyed hill-men, who had just arrived and were depositing their loads; but on bringing the spy-glass to bear on them, it showed they were gooral, so I lost no time in trying to circumvent them. Leaving my companion seated on the rocks below, from whence he could command a view of the whole proceedings, I commenced working upwards along the edge of the precipice, where the ground was favourable for the stalk, until I got within what I judged to be well over 200 yards of the animals. Nearer than this I could in no way approach them without their detecting me; so there was nothing left but to chance a long shot, with little hope of hitting such a small mark at so great an angle upward. They were now standing motionless, apparently watching the men moving about below; and their colour so much resembled the ground they were on, that I again had recourse to the glass to enable me, before shooting, to clearly distinguish their outlines from those of the rocks among which they stood. Steadying my elbows on a convenient slab of stone, I took a careful and deliberate aim at the larger of the two and let drive. It staggered for a few moments, and then, toppling over, fell on to a narrow ledge about 50 feet below it in the precipice, close above the brink of which it had been standing. Off this it shot down through

space. I watched it almost with a thrill of awe, as it went whirling through the air, until the latter part of its descent was hid from my view by the crags that projected over the profound depth below. So fascinated was I by this extraordinary, I may almost call it appalling spectacle, that at first I forgot to notice what had become of the other gooral. I now observed it climbing away over the steep rocks, so I chanced the contents of the second barrel at it. The bullet must have shaved, if it did not strike it, for it seemed to crouch down for a few seconds before finally disappearing.

I now got back to where I had left my companion below. He had been able to see the falling gooral for the whole length of its tremendous descent, during which, he said, it had only touched the rocks twice. I afterwards ascertained, with my mountain aneroid, that the drop was almost a sheer 1000 feet.

As we sat there watching our little tents being pitched, the noise made by the men who had gone down to fetch the fallen gooral disturbed another that had been reposing in some secluded niche beside the big precipice. Across the face of this the sure-footed creature took its way along an almost imperceptible ledge, which could only have been a few inches wide. When about half-way over it stopped, with its head craned forward to gaze down at the men, who had just reached the dead beast below.

I signalled to the men who were pitching the tents a short distance below where my companion and I were seated, to bring me up my rifle (which I had left there), with the idea of taking a sky shot at the beast, but without a notion of being able to hit it; for, although nearly on a level with us, it was fully 300 yards off. Sighting for that distance, I lay down and took my shot. Judge of our astonishment, then, at seeing the animal fall from the ledge and drop clear 500 feet, down almost beside where, on a steep sloping chaos of loose rocks and *débris* that had originally slipped from the precipice above, the first gooral lay, and nearly on to the

heads of the men who were preparing to shoulder it. The mangled remains of the two goorals were soon brought up, when we were surprised to find them much less smashed and torn than might have been expected, owing probably to their having fallen so clear of rocks.

The rifle that served me so well on this occasion, as well as on many another—although seldom, if ever, with such astonishing results—is still in my possession: a .450 bore, double, muzzle-loading Whitworth; and never was bullet thrown from a more trusty weapon. The dear old-fashioned thing, there it stands in the rack before me now as I write, and there it shall remain as a memento, nothing more, of many a happy day passed with it among the fells and forests of the grand old Himalayas.

In the evening I climbed up to the spot where the companion of the first gooral I had killed had disappeared, but found nothing on its tracks to show that it had been wounded.

After turning in at night, when all else was silent and still, we heard eerie sounds and a weird-like rustling of wings, as if the restless spirits of the haunted mountain were flitting through the air. But I soon discovered they proceeded from several nightjars that were flying to and fro close over the camp, having probably been attracted by the moonshine on the white tents. In the uncertain light, I at first took them for woodcocks, which, among the higher ranges, sometimes come hovering over the camp-fires after nightfall.

On the fourth day we shifted our tents a few miles, to a ridge that overlooked the Doon stretching away like a big green map far below. Early in the morning, whilst searching for game with my shikaree along a circuitous route towards our new camp, I noticed, away on the sky-line, the dark form of an animal which the glass showed to be a surrow. We waited until it moved out of sight beyond the steep-sloping ridge on which it had been standing, and then made the best of our way there. We were clambering

round the rocky shoulder of the ridge, when I caught sight of the animal a short distance below me; but having got wind of us in some manner, it rattled away down the rocks, and before I could cover it with the rifle, was out of sight in a deep wooded "khud"¹ immediately beneath.

As I stood on a projecting crag, disappointedly gazing down in the direction the surrow had gone, the head and shoulders of another suddenly emerged from behind a rock not twenty yards below me. I was considerably out of breath from climbing, and the space I had almost to balance myself on was so limited and so directly over the animal, that I missed it, or at any rate made a shockingly bad shot. It must, however, have touched the beast somewhere, for I was close enough to hear it give a low kind of grunt, as it dashed off, like a rocket, downwards after its companion. We followed a short way on its bloodless trail, and then, feeling much mortified at my muffish performance, made straight for our new camp, which had been pitched on the ridge running along the opposite side of the wide khud, in the dark silent depths of which the surrow had taken refuge.

After a late breakfast, as I sat deliberating as to whether it would be worth while turning out all our men to search the gorge below, on the faint chance of finding the surrow lying wounded there, one of them came running to tell me he had seen a surrow moving among the rocks and bushes far down on the opposite face of the khud. On taking a look through the glass there, I saw the beast, and, strange to say, not very far from where our two friends of the morning had been lost sight of. We watched it until it moved behind some bushes, and as it did not reappear, we concluded it must have lain down there; so I at once arranged for attempting a drive, the ground being rather unfavourable for a stalk. Sending some men round behind the

¹ "Khud," or "khālla," is the native term for a steep-sided, V-shaped gorge, as "pākhān" is for a precipice, "khānta" for crags, and "pāhār" or "teeba" for a mountain or hill.

ridge above the bit of cover the surrow had entered, I proceeded to take up a position commanding as much of the steep broken ground below it as possible, thinking that the animal would be certain to make for the dense ringals at the bottom of the gorge. At last one of the men appeared on the ridge, and pointing significantly towards the bushes, soon drove the animal out by flinging down a stone. But the cunning brute must have detected me below, for instead of coming downwards, as I had every reason to expect, it took a slant upwards, and never stopped until it disappeared over the sky-line far away at the head of the glen; so I had once more to return dejectedly to the tents.

That evening one of the men reported his having seen, in the gloaming, a surrow moving among the oak-trees near the head of the glen, when fetching water for camp from a spring there,—probably the animal we had driven from its usual haunt returning to rejoin its companion. For surrow seem to be very domestic in their habits, with respect to their family ties; but as their homes are rather extensive and difficult of access, an interview with them is by no means easy to obtain.

Next day being Sunday, we gave ourselves and the surrow a rest. As we reclined on the grass near our tents, enjoying the cool evening breeze and looking down on the forest-clad Doon 4000 feet below, the prospect was singularly beautiful. The sun was sinking, like a fiery red ball, in the haze that dimmed the distant plain stretching away beyond the low irregular line of the Sewalik hills; whilst behind us, over the tree-tops, rose the pale full moon like a huge silver globe. Again the surrow was seen just before dark by our men who were fetching water, so I determined to organise a regular beat through the gorge on the morrow.

Early next morning I worked over some old landslips eastward of our camp, the long steep slopes of which, where not too rocky and precipitous, were now clothed with spear-grass and brushwood, interspersed here and there with oak and cheer-trees.¹ On one of my previous visits to this

¹ The cheer-tree (*Pinus longifolia*) much resembles the Scotch fir, but with

locality I had killed a fine surrow there; this time, however, I saw only one or two gooral and a barking-deer. I may here give an instance, which came under my observation, of how wild animals may recover from bad wounds. On one occasion when hunting on this ground, I shot at a gooral—one of a herd of five or six—which went off with its fore-leg so smashed that I even found bits of bone on its track. The following year I was shooting there again at the same season—November—when I saw what was doubtless the identical herd on almost exactly the same spot, and shot one out of it. This animal was found to have a stiff knee-joint, the leg having evidently been broken by a bullet, but the bones had reunited in a long indurated lump; and I have little doubt but that it was the same gooral I had wounded there just a year before. I have the bone thus mended by nature now in my possession.

In the forenoon all our forces were marshalled, and most of them placed under command of old Hookmee, the local shikaree, to be disposed in the manner he thought best for driving the gorge below. Strict injunctions were given that no other noise was to be made than an occasional tap with a stick on a tree-stem, except by the scouts posted on points of vantage to watch the gorge as the beaters moved down it, and to signal by voice any movements of our game they might detect therein. This precaution regarding noise is always necessary when driving deer in cover, as the beaters usually make such an infernal row, and the game gets so bewildered by their echoing voices, that a beast is just as likely to break back as to rush madly forward in its terror, instead of moving on leisurely, as it otherwise would be pretty certain to do.

Whilst Hookmee is proceeding with his small army of beaters towards the head of the glen, I start off to take up a position far down it, on a sort of promontory, overlooking as much as possible the main gorge on the left, as well as a

longer and paler-green spines. It is the commonest kind of pine that grows on the lower and middle ranges.

smaller lateral one on the right, running into the main one just below me, and up which offshoot Hookmee says the surrow may possibly take.

As I sit there expectant among the rocks, being half baked by the hot March sun, I can hear the beaters as they come slowly down through the ringals and trees in the khud, but only the sound of their tapping-sticks, for old Hookmee has got them well in hand. Presently a voice comes from high up on the opposite side of the glen. It proceeds from one of the scouts stationed there, calling my attention to two surrow he can see passing along the rocky face below me on the left; but the ground is so steep there, that to me they are invisible. Again he shouts that they have turned up the smaller gorge to the right, and I have not long to wait before a rustle among the dry fallen leaves apprises me that something is coming up it. But the beast keeps so well concealed in the thick cover, that it passes on without giving a chance for a shot. It is followed almost immediately by its companion, which suddenly detecting me, turns sharply round, and, under cover of the brushwood, makes for the opposite ridge of the ravine. More fortunately for me than for the surrow, it has to traverse an open bit of steep ground before it can reach the ridge; but a bullet from the Whitworth catching it in rear, turns it back. It stands for a few seconds as if bewildered, when another bullet causes it to totter back down towards the cover at the bottom of the ravine. A movement among the bushes below me now attracts my attention, and almost directly I catch sight of the first surrow, which, probably missing its mate, has returned in search of him, and is now standing broadside on, in a small open space among the brushwood, within fifty yards. The contents of my second weapon, a miniature '360 express, sent into its shoulder, floors it at once in its tracks.

I now devote my attention to the other surrow, which I find is so sick as to be incapable of moving away. I have hardly settled it with the "pea-shooter," when again I hear

shouts from a marker. He has seen yet another surrow, which, he says, has crossed the foot of the lateral gorge, and is now moving beyond it along the precipitous face on my side of the main one. I at once send several of the beaters, who have just joined me, round to try and intercept the animal, but the ground there is too steep and difficult for them to travel over. All they can do is to shell the place with big stones, so I am not surprised that he gives us the slip. Nor am I much disappointed either, being quite satisfied with the two animals secured.

One of the dead beasts had a half-healed bullet-hole in its ear, and was most probably the first surrow I had seen and shot at a few days before, not very far from where it had now fallen. Both were good specimens—a buck and a doe—and carried almost equally long horns.

As nearly all our manœuvres had taken place within sight of the camp, my companion on this trip had once more an opportunity of watching them almost from his tent. This was a very satisfactory termination to our pleasant week's holiday.

-- *Village, Gurhwal Mountains.*

CHAPTER XIII.

TOWARDS the middle of a very hot summer in the Punjab, I started for the Himalayas on two months' leave. From constant confinement indoors—where the sojourner in the plains of India during the hot season is constrained to shut himself up all day in a darkened room to avoid the intense heat and glare—I had been getting into that unhappy frame of mind which makes life almost a burden, and from want of sufficient light and fresh air, my face was rapidly assuming the blanched appearance presented by the inside of a tied-up cabbage. After this dreary monotonous sort of existence, it can easily be imagined with what keen delight I looked forward to being once more free to roam among the pine-forests and snowy regions of the Cashmere mountains.

My intention this time was to hunt markhor on the western end of the Pir Punchal range, above the sources of the Bonyar river. I chose this locality because I knew it had not been much hunted over for several seasons, although it had not as great a reputation for big markhor as other places I had visited.

If one wishes to have good sport in a foreign land, the first and most important thing to be done is to endeavour as much as possible to ingratiate one's self with the people of the country in the vicinity of one's hunting-ground. Acting upon this principle, which I have always put into practice, I proceeded to pay my respects to a nawab (native gentleman) who was the proprietor of part of the land I

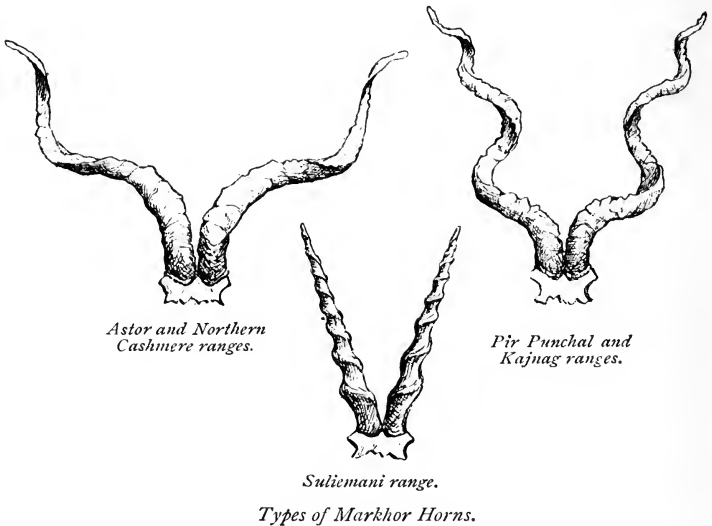

wished to shoot over. His residence was some six miles from Uri, on the Murree route to Cashmere, but he happened to be at Uri the day I reached that place. Shortly after my arrival, an individual of very imposing mien, and extensively arrayed in the sporting style of costume usually affected by the impostor class of Cashmere shikaree, swaggered up in the most confident manner and offered his services. On being informed that they were not required, he turned on his heel and stalked proudly away. He, however, continued to prowl about in the vicinity, and in the afternoon, just before I started, again presented himself, when, by way of getting rid of him, I pointed to one of the heaviest loads, and told him that if he chose he might carry it, which offer he treated, as I expected, with silent contempt, and disappeared. The next time I saw my friend, he had divested himself of most of his fine garments, and his fine airs also, and was toiling up a hill with the identical heavy load on his back. Finding I was not to be taken in, I fancy he had thought better of it. Though I have called him an impostor with regard to his capabilities as a shikaree, he was anything but one in his proper capacity as a weight-carrier; for, to do him justice, he afterwards turned out to be one of the most willing and hard-working men I employed, and whenever there was anything to be done that required more than ordinary strength and activity, Kazima was always to the front.

From Uri I was accompanied by the Nawab, who beguiled the time passed on our way with accounts of the kind of sport I was likely to get, and also with some of his own hunting experiences—for both he and his younger brother were men of sporting proclivities—and on our arrival at his village after dark, nothing could exceed his hospitality and attention to all my wants.

The following day was devoted to purchasing a stock of supplies for my men and making a few final preparations for our mountain work. The Nawab provided me with his

two best shikarees—Gamoo and Hatha. The former was a very intelligent little man, with a bright good-humoured countenance; the latter, who acted under Gamoo's orders, was an active, willing fellow.

Before proceeding further, it may be as well to give a slight description of the noble animal we were about to seek. The markhor (*Capra megaceros*), or, in English, snake-eater, so called from his being supposed by the hill-men to be what his name implies,¹ is without doubt the finest animal of the wild-goat tribe. There are several known localities in the northern Himalayas and in the mountains on the north-west frontier where it is met with, besides the comparatively unknown ones more northward, and in each of those known it differs slightly, principally in the shape of the horns. The

horns of the variety found on the Pir Punchal and Kajnag ranges, west of the Cashmere valley, have three or four spiral curls in the shape of a cork-screw, and sometimes grow to an

¹ It may not be generally known that goats are ordinarily addicted to snake-eating,—so say the highland herdsmen, at any rate.

MARKHOR (PIR PUNCHAL).

extraordinary length. I measured one that was 63 inches following the twist, and considerably over a yard straight. But this was an exceptionally fine specimen, and only a single horn, which was purchased at a village. The markhor found on the more northern mountains of the Cashmere territory are in colour and size much the same as those of the Pir Punchal, but their horns have fewer turns, although they grow equally long, and, as a rule, more massive. Markhor are there sometimes found on the same ground with ibex. In the Dehrajat country, west of the Indus, the markhor are somewhat smaller, with horns shorter, straighter, and screwing more sharply, like a twisted ribbon. Those found on the hills north and east of the Peshawar valley appear to carry horns of a size and twist something midway between the Pir Punchal and the Dehrajat varieties, judging from the only two specimens I saw from that locality.

A full-grown buck of the Pir Punchal stands about 44 inches at the shoulder. Like most other wild animals, the appearance of its coat varies with the seasons. During the spring and early summer the colour of its shaggy body and of its face is a dirty yellowish white. Towards winter it becomes more of a brownish grey. The legs are brown. From the throat and all down the chest flows a dark-brown beard or mane, sometimes so long as almost to sweep the ground, which, with its huge V-shaped spiral horns, gives this animal a truly majestic appearance. The average length of really good horns ought to be nearly, if not quite a yard, measured without the twist, but they occasionally exceed this considerably. The circumference at the base is sometimes almost a foot. The doe, which is called "bukree," simply meaning she-goat, is not more than half the size of the full-grown buck. She is of a uniform light-brownish dun, and carries small spiral horns which seldom attain a length of more than 15 inches. The young bucks, called "rind," are not easily distinguished in a herd from the does, with which they are generally found in com-

pany. The old hoary bucks only are termed markhor, and like the ibex and the tahr, they generally herd separately from the does during summer. The females do not, I think, usually have more than one kid, as I saw many of them with their young, but never with twins.

Markhor seem generally to prefer steep, stony landslips, precipitous grassy slopes, and rocky acclivities clad more or less with pine and birch, to the more open ground near the upper snow-fields and glaciers; consequently their pursuit is sometimes attended with even more difficulty and danger than that of ibex—for the earth in such places is often so friable, loose, and rotten, and the short dry grass is so smooth and slippery, as to make the footing there most treacherous. Even in the depth of winter the old bucks seldom quit their fastnesses, where they are said then to subsist chiefly on pine-shoots.

Trusting that my imperfect description of the “king of wild goats,” as Gamoo called him, may have given some idea of his appearance and habits, we will now start for his wild domain.

Gamoo’s intention was first to make straight for a remote and lonely tract of the mountains, where he thought the big old bucks were pretty sure to be found at that season—June—and which it would take us at least three days to reach. After packing off the men carrying the loads, with directions to pitch our little camp at a suitable spot, known to Gamoo, some distance down the other side of a lofty range that rose about a mile or two behind the village, I started at an early hour under the guidance of the shikarees. Although at that time of year great old markhor were not likely to be met with so low down, a chance might be got at a rind (young male), a musk-deer, or a bear.

After several hours’ hard climbing along rough stony beds of water-courses, up slopes of loose *débris*, and through steep pine-forests, we at length neared the upper part of the range. As we continued to ascend, the ground became more rugged

and precipitous. Broad patches of melting snow, in many places very deep, still lay on the mountain-side, often forming a treacherous covering over gullies hidden by it, or to slippery branches of birch bushes that lay pressed down by its weight along the steep ground beneath, and on which our feet were continually either slipping or tripping.

What a glorious panorama presented itself from the summit of the range where I sat down to rest and to enjoy this magnificent prospect of mountain piled behind mountain, stretching away as far as the eye could reach! The day was one of those when, from the sky being overcast, the light was of that dull subdued kind, which gave to the more distant ranges an intense dark-blue tint, causing them to appear more solemn in their grandeur, and the valleys lying between them more profound in their depth, than had they been lighted up by the glare of a bright noonday sun. And the heavy pall of cloud that rested on some of the higher mountains threw a gloomy shade over their snow-clad sides immediately beneath, giving one a vague and an exaggerated idea of the height of their hidden crests.

A thin blue line of smoke curling lazily up from a sheltered spot among the pine-trees far below, showed us that the men with the loads had reached the place where it was intended we should pass the night. I was not, however, destined to reach it without the occurrence of a rather serious accident, which nearly brought my shooting-trip to a premature end.

The chilling wind that blew over the ridge, off the snow, reminded me, as I sat admiring the view, that it was not advisable to remain inactive. We therefore commenced descending towards the camp. The declivity, although very steep, would not have been difficult to traverse had not the ground been covered with a layer of half-melted slushy snow, which made the footing slippery and uncertain. I was walking rather carelessly, and happened to place one of

my feet, on which I was wearing straw *poolas*,¹ on a smooth birch branch that lay hidden beneath the snow, when my legs seemed suddenly to fly from under me, and away I went slithering down the steep slope. Fortunately I did not go very far; but when I picked myself up, which I did with the assistance of my two men, who ran down after me, I felt uncommonly sore all over, and there was a painful, partially numbed sensation about my left shoulder and arm that made me feel rather faint. On recovering from the shock, I soon became aware, from the position of my arm and my inability to move it, of the disagreeable fact that I had put my shoulder out.

Here was an awkward predicament to be in. I was sitting on a hillside, as steep as a house-roof, with a dislocated shoulder, and no surgical aid within at least four days' journey. Bad as matters seemed, I could not but be amused at the ludicrous picture of helpless concern presented by my two companions, more particularly by old Gamoo, who could do nothing but call on the name of the Prophet for help. Hatha was the first to regain his wits, he having acquired, more fortunately for me than for him, some knowledge of an accident of the kind by a similar one having formerly happened to himself; and from its occasional recurrence, which is, I now know by experience, often the case with dislocations, he had become rather expert in its treatment. Being fully alive to the necessity for immediate action, I directed the men to haul away at my arm, which they did for some time, with no better result than to make me feel very faint. This treatment having failed, with some difficulty I stood up on the steep slope, whilst Hatha made a lever of my arm, with Gamoo's shoulder under it for a fulcrum. My own weight on one

¹ Hob-nailed boots I found safer, on the steep slippery slopes of dry grass so common in markhor ground, than *poolas*, which on these dangerous slopes become very dry, and consequently are apt to slide; so it is as well to be provided with both.

side and a steady pull at the arm on the other, had the desired effect, for I could again move the limb; and on examination, Hatha, with a grin of satisfaction, pronounced it to be all right.

At the camping-place I found the Nawab and his brother, who were carrying out the rites of hospitality to their fullest extent, by escorting me as far as the confines of their property. Their apparent concern, on hearing of my mishap, was almost as great as that of the shikarees, and many were the remedies suggested, which were about as useless as they were well meant.

I had considerable difficulty in getting out of my upper garments that night, and still more in getting into them again next morning; but as the Nawabs were bent on showing me a drive for game, I was determined to try and go out, even although I might be unable to use a gun, rather than disappoint them. Fortunately, the place where Gamoo, as the Nawab's head gamekeeper, planted me, was not far distant; so I sat down at the root of a pine-tree, there to await the advent of anything that might turn up. The only animal that put in an appearance was a half-grown black bear, at which I was able to "loose off" by supporting the rifle against the trunk of the tree beside me. I almost think I must have hit the beast, for with a loud "yeeough" it staggered back and disappeared down the hill. The Nawab and his brother, who were with the beaters, had seen two musk-deer, but nothing was bagged. My hospitable friends took their departure next morning, and I proceeded on my way; but, from my shoulder being stiff and painful to move, I was forced to take matters pretty easily for a day or two, until we reached our first hunting-ground.

During our short stay here I shot a young buck, one of a herd of five that we found feeding on a very steep and bare slope of short slippery grass. Down this declivity the stricken animal went tumbling and sliding at a most fear-

ful rate, until it was lost to sight a thousand feet or so below. Difficult and dangerous as already was the walking over such a smooth sloping surface, it was rendered even worse by heavy rain which had fallen during the night. Two black bears and a brown one had shown themselves at long distances, and also some rinds and does; but as there were no fresh marks of large bucks, we determined to try other ground.

CHAPTER XIV.

GREAT old markhor are always difficult to find, owing chiefly to their usually affecting such inaccessible places, and generally where the precipitous ground is tolerably well clothed with pines and birches. Gamoo now proposed that we should bivouac high up among the pine-trees on a neighbouring spur, on the farther side of which he was confident we should find some old fellows. Accordingly, in the early morning the little tents were struck, and directions left to have them pitched wherever sufficient space could be found beside the torrent at the bottom of the deep narrow valley we had to cross; whilst the shikarees and I went on to the new ground, taking with us two or three men to carry our food and blankets.

After a long and tiresome descent, succeeded by a tedious, hard climb, much of it being up a landslip, where the steep stony ground was so unstable as to make the foothold bad, we reached our destination late in the afternoon. On our way we knocked at the door of the residence of a bear in a hollow pine-trunk, our attention having been attracted to it by the fresh marks of claws on the bark, where the occupant had clambered up to the entrance-hole. Mr Bruin was, however, either "not at home," or too lazy to pay any attention to our summons.

The evening was spent in making ourselves as snug as possible for the night. It was dreadfully cold up here, the ground being partially covered with patches of snow. A

lot of dry pine-logs were collected in a heap, and as the shades of night gathered in, a huge bonfire was cheerily crackling and blazing away, dispelling the surrounding darkness, as the ruddy glow was reflected on the nearer pine stems and branches, or penetrated into the gloomy recesses of the forest. A tin-can of soup was soon heating over the fire, and thick cakes were placed under the hot ashes to bake, first having been wrapped up in several layers of fresh birch-bark,¹ which gives them a nice flavour and prevents their being burnt. In this manner the evening meal was not long in being prepared, and discussed with a relish seldom experienced except under such circumstances. The fragrant weed was lit, and a lump of snow put into the kettle to boil, and a glass of "hot with" mixed, ere turning in on a soft couch formed of pine-branches so arranged that only the tender sprouts remain uppermost.

I may here remark that although a glass of hot grog is very grateful and comforting to the Himalayan sportsman after he has done his day's work, he will, I think, find cold tea far better than spirits and water, both for quenching his thirst and working upon during the day.

By daybreak we were on the move towards the wooded steeps and precipices above. After an unsuccessful morning's work, I took the spy-glass to have a final search over the ground before descending to our bivouac for breakfast.

There they are ! I have them at last, a herd of eleven in all ; and though they are so far off that we cannot distinctly make out the length of their horns, we can tell, from the white colour and size of their bodies, that the three foremost fellows are old markhor. They are slowly moving up to higher regions after their morning meal, and Gamoo says they will be pretty sure to descend in the afternoon towards

¹ Birch-bark is a staple commodity of commerce in Cashmere, where its thin under-layers almost entirely take the place of paper with the shopkeepers for wrapping up the purchases of their customers, besides for the many other useful purposes to which it is applied.

the same feeding-ground. Under these circumstances it is useless attempting to approach them at present: we therefore continue to watch them until they are hidden from our sight, and then descend to our bivouac, intending, after breakfast, to make the best of our way to the spot where they were last seen, there to await their return.

Our meal is soon despatched, and we are off again. Our progress, however, is slow, for the ground is very difficult, and much time is taken up in digging footsteps across bad places. We take little heed of a buck tahr¹ (here called "jagla"), though he might be easily stalked were we not in pursuit of other game, which a shot might disturb; and after several hours of climbing and scrambling along, we at length reach our goal.

Dense masses of murky cloud and rolling mist have been for some time gathering about the crags above us, and distant rumblings of thunder herald an approaching storm. The rain, which soon begins to fall pretty smartly, combined with a cutting cold wind, almost benumbs my limbs—for, in my anxiety to be after the markhor, I have forgotten my usual precaution of bringing a blanket with me. Patiently we sit there huddled together, our teeth chattering and bodies shivering with cold, and I am just about to suggest the propriety of returning to a spot where we intended passing the night, when the rattle of a falling stone, detached somewhere far up in the mist, falls faintly upon our ears.

"They're coming down now," whispers Gamoo, followed by a suggestion that we should get more under cover of the ridge of the spur on which we have posted ourselves. Anxiously we crouch there, straining our ears to catch the slightest sound; but nothing more is heard save the soft patter of falling drops, the echoing claps of thunder, and the sough of the wind among the swaying pine-

¹ On the Pir Punchal the tahr is frequently found on the same ground as the markhor.

branches, until I begin to think the falling stone must have been loosened by the rain. But listen!—again the rattle of loose stones, and this time much nearer. Oh for a break in the dense mist that is scudding past, to give us a sight of the markhor, which, there is now no doubt, are on their way down to where they fed in the morning! At last fortune seems to be going to favour us, for the rain ceases, and the pall of cloud is gradually lifting, as rock and tree above begin to loom indistinctly through the flying vapour.

“Look!” again whispers Gamoo, his voice trembling with excitement, as he points in the direction of several tall pine-trees on a ridge some distance from and considerably higher than the spur that conceals us. About a couple of hundred yards beyond two of their massive stems—which form, as it were, a kind of huge rustic framing—such a truly wild tableau as seldom is witnessed becomes gradually disclosed to view. The undefined form of a stately markhor is emerging like a spectre from the mist, slowly wending his way downward. He is immediately followed by another, and yet another, equal in size to himself, whilst a string of smaller animals bring up the rear. As the leader reaches a broad ledge jutting out under a dark beetling crag, he wheels suddenly round and butts at one of his big followers, which, with lowered head, is ready to receive him. After a tilt or two, the leading buck advances to the brink of the ledge, where he gazes proudly about him for a short time, and then lies down with a listless confident air, as if quite satisfied with the security of his exalted position. How noble he looks, as he reclines there with his grand head towards us, his massive horns standing out in relief against the dark background of overhanging rock! I can almost count the hairs of his flowing beard as I watch him through the glass. The remainder of the herd have all trooped down behind him, and form an almost supernatural-looking group of wild beings, which seems to dissolve gradu-

ally away as the veil of mist again steals up and conceals them from our entranced gaze.

How to stalk them is now the question. The only place from which there is a chance of getting a fair shot is the ridge above, where the big pine-trees are, as the nature of the ground is such that the animals will be pretty certain to move down on the other side of it, and so out of our sight. There is only a short distance across to it, but should the mist clear off before we can reach it, we shall be in full view of the herd; and the slope is so frightfully precipitous, that it makes one almost shudder to contemplate what the consequences of a false step on the wet slippery ground might be. However, there is no time to think much about it, for the mist may lift again at any moment, when our chance of reaching the ridge unobserved will be gone; so, screwing up my nerves, I determine to risk anything rather than lose such an opportunity.

Slowly and carefully we plant the sides of our feet in the small nicks scraped out of the face of the hard, almost perpendicular slope, with the iron spuds on our long sticks, and luckily reach the ridge just in time, for we can hear the animals on the move again though we cannot see them. Sticking the points of my toes into the ground, I cautiously slip the long barrel of my single Henry rifle over the ridge, whilst Hatha lays hold of the loose part of my nether garments, for so precarious is the footing that even the recoil of the rifle may cause a slip. Once more the mist clears off and discloses the whole herd, now coming straight down towards us. As Gamoo crouches beside me, ready to hand me my second rifle, a double (not the Whitworth then, or it should have had the post of honour), I can hear him praying to Allah and the Prophet for help, and cautioning me not to fire in a hurry, alternately. The leading buck is within fifty yards and broadside on, when Gamoo whispers, "Now, take a good aim."

Can I have missed the beast?—for he still holds steadily

on without a sign of being hit. But another big fellow has reached the same spot. Quickly Gamoo hands me the other rifle, and ere the animal has time to recover from his astonishment, a bullet smashes through his shoulders, his fore-legs slip from under him, and he rolls headlong down the gully in our front and disappears. The third big buck now takes his place, for there is only one way by which they can pass us, and I am just about to fire when Gamoo directs my attention towards the first, which has pulled up, and offers a fair chance. Supposing him untouched, I empty the remaining barrel at him. He moves on a short way, stops again, totters for a few seconds, and falls struggling down into a cleft between a steep face of rock and a sloping bank of hard snow just below him. Both rifles being now empty, the remaining big buck gets off scot-free, and vanishes with his smaller companions long ere I can reload.

Numerous and loud are the expressions of delight indulged in by the shikarees at our good luck. But a shadow of doubt arises in their minds as to whether they will be able to reach the beasts in time to bleed them before life is extinct, as, being good Mohammedans, without this ceremony being duly performed the meat will be useless to *them*. Hatha and Sultana—our spare man—at once start off down the gully to look after the second buck, whilst Gamoo and I with some difficulty clamber after the first. We find him still alive, but he has fallen so far into the cleft that we have considerable trouble in getting at him to give him the *coup de grâce*.

On examining the carcass, I found that my first shot must have inflicted a mortal wound. Had I known this I might in all probability have killed the third big fellow with the bullet I had wasted in firing a second shot at the first; for unless some large bone is broken, markhor, like ibex, when shot at, and even if mortally wounded, very often move off without increasing their pace from a walk. However, I had little cause to grumble at my luck.

It was too late to get the dead markhor out of the snow-cleft that evening; we therefore followed the other men down the gully to where they had found the other buck in time to bleed him. We had only to give his carcass a shove to start it rolling down several hundred feet, until it reached a long narrow incline of hard snow that covered the bed of a torrent which could be heard murmuring beneath. We were able to drag the beast easily down the slippery snow-bed for a long distance, fortunately in the direction we wished to go.

Leaving the men to skin and break up the markhor, I made the best of my way along a steep pine-clad hillside to the spot where we intended to bivouac for the night, the position of which I discovered by continually shouting and whistling on my fingers—a most useful accomplishment under such circumstances—until I was at length answered by the men who were there. It was dark when I reached it, so I at once sent off a couple of men with pine-torches to assist the shikarees, who arrived some hours later with as much as they could carry of the spoils.

Koklass pheasants were crowing and the horned argus uttering its peculiar mewling cry when I awoke in the morning. Sending off a man with strict injunctions to mark the whereabouts of one of the *latter* beautiful birds, a good specimen of which I particularly wished to obtain, I hastily emerged from under my warm blankets, and performed my morning toilet, which consisted chiefly in donning my boots. The fellow soon returned, and after leading me a stiff pull up through the forest, pointed out one of the former birds, at which piece of stupidity my temper was considerably ruffled.

In the forenoon we shouldered our limited kit, and made for the camp, which was not very far off. I had directed some men to go and prospect the ground towards the head of the glen in which the tents were pitched. They now, much to my disappointment, reported it as being entirely

blocked up with snow, and the torrent quite impassable; but being fully alive to the lazy and mendacious propensities of the Cashmeree, I was resolved to go and have a look myself. It was necessary, however, to remain where we were for a day, as the greater part of one markhor had still to be fetched, and the whole of the other was still lying in the snow-cleft where it had fallen. This delay afforded an opportunity for a general washing-up of dirty clothes. What a luxury it was to have a bath, and to turn in again on my camp-bed and be lulled to sleep by the resounding din of the torrent, that hurried down impetuously within a few feet of the tent! And as morning dawned, how pleasing to hear the blackbirds (just like our old friends at home), which were numerous here, mingling their notes with the rushing sound of the water. As there was an icy blast coming down the glen, and it began to rain heavily, and most of the men were away after the venison, I thought I could do nothing better than take another turn in my warm bed until a pretty late hour.

On the arrival of the meat, my Goorkha servant Kirpa at once proceeded to cut quantities of it into long strips, with a view to jerking it for future consumption; and ere long, yards and yards of it were hanging in festoons from frames of sticks, constructed over smoky fires lighted all around.

A terrific thunderstorm, accompanied by hail and rain, prevented our moving early next day; and after the storm was over, the mountains were so enveloped in mist that stalking was impossible. During our stay here Kazima brought me a fine pair of markhor horns he had picked up somewhere near. He was much perplexed at my not caring to possess such a trophy, merely because I had not shot their wearer, and said he should keep them himself, to dispose of to some other person who might not be so particular as to how they had been obtained.

When the weather had cleared enough to allow of a move

up the glen, I found, as I expected, that it was by no means so impracticable as the men had reported. For the first mile or so it certainly was very difficult travelling; but the huge piles of hard snow which blocked the contracted and precipitous gorge up which our way led, were rather an advantage than otherwise, enabling us to cross and recross the torrent by natural bridges formed of them. Higher up, however, the valley became more open, and was pretty free of snow. A more likely country for sport there could not have been, and it did not belie its looks; for we soon found the fresh tracks, as big as though they had been made by heifers, of a herd which must have fed there that very morning. Matters looked so promising that I sent back a man with directions to have the tents brought on; for we had only taken with us kit sufficient for passing a night or two under the best kind of protection from the weather we could find.

We were not long in selecting a snug spot for spending the night under some splendid pine-trees, which were almost impervious to rain. Here we sheltered from a heavy shower, which lasted several hours. Towards evening it cleared up; so I started with Gamoo and Hatha, intending to prospect the ground on either side of a steep, craggy, and partially pine-clad ridge, that ran up towards the snowy heights far above.

First we sighted two rinds, which were not worth the risk of disturbing the ground by firing at, even could we have stalked them successfully, or had cared to do so. Three or four fairly large bucks were also made out among the crags on an opposite hill-face, but they were evidently not the big fellows that were "wanted"; and a deep precipitous-sided valley that lay between us and them, with a roaring linn at the bottom of it, precluded any possibility of our getting near them that evening. We therefore began descending the ridge we had come up, in the hope of finding them again at some future time.

Hardly have we gone a couple of hundred yards when,

hark! something has detached a stone up on the steep hillside to our left, and we have barely time to crouch down among the rocks on the ridge ere a hoary old buck, with a huge pair of cork-screws on his head, shows himself for a second or two, as he crosses a bare spot among a lot of birch bushes some three hundred yards distant. Five or six others of equal size follow closely in his wake. These must certainly be the beasts whose heifer-like tracks we saw below, and they are evidently on their way down to feed.

The ridge is so craggy and steep that it will take all we can do to clamber down and intercept them before they get near our bivouac, where they must certainly detect the men left there, for the beasts are making straight downwards in that direction.

Off we start under cover of the ridge as fast as the ground will allow of, passing the rifles from hand to hand down the more precipitous spots, and every now and then peering over at the markhor, upon which we do not appear to gain an inch, but if anything lose distance. Presently we reach a bit of more practicable ground, where we are able to travel faster, and when we again reconnoitre the animals, we find we have succeeded in getting a little ahead of them. There is no time to lose, however—for, as far as I can judge from the direction they are taking, they will pass us at about 130 yards, and if we let this chance slip they are lost.

I have scarcely got into position for a shot before they are abreast of us; but the birch bushes are so thickly scattered over the steep hillside, that we only catch occasional glimpses of the animals as they move amongst them. Taking advantage of a convenient bit of rock for a rest, I let drive at the first buck that shows himself. He fortunately happens to be a beauty. To my intense concern, he only acknowledges the shot by a spasmodic movement of his short tail, as he turns round and slowly retraces his steps up through the brushwood. Quickly exchanging the

empty single rifle for the double, another bullet speeds after a grand fellow, as he appears traversing a small opening between the bushes. This time a decided wince follows the shot in addition to the shake of the tail; but he moves steadily upward with the rest, until they file slowly over a bare bit of ground, all of them now in view, but almost out of range. In despair I give them a parting salute with the remaining barrel before they become hidden, one by one, from our sight.

A feeling of helpless disappointment seems to pervade us all as we sit mutely there gazing up to where the animals have disappeared. So disgusted am I with my performance that I hardly care to reload the guns. At length Gamoo breaks the silence by expressing a decided opinion that, from the fact of their "wagging their tails," as he put it, on receiving the shots, one buck is hit, if not both. Whilst he is speaking, a clattering noise is suddenly heard far up in the direction the beasts have taken, and to our great joy we soon see it is caused by one of them coming toppling and rolling down until it lodges among the bushes below. After intently listening for some time, in hopes of another following suit, we jump up in great glee, and proceed to examine our prize.

I certainly ought to have been satisfied with my success in securing such a magnificent trophy, for the horns were almost a yard in length, measured straight without the twist, and were nearly a foot in girth at the base; but there is invariably one bitter drop in one's cup of happiness. We now discovered that my first two shots, both of which turned out to be deadly, had unluckily been at the same animal, which I had mistaken for a different one when I fired the second time as he moved up with the others among the birch bushes. We sighted a black bear in the distance as we were descending to our shelter. It was much too late to go after him; and what cared I for a bear then, compared with the noble animal I had just shot!

Besides the superstition respecting the snake-eating propensity of the markhor, there is another entertained regarding a small, smooth, dark-green stone¹ which is sometimes found among the entrails of very old bucks. My attention was drawn to this when, before starting for the hill in the early morning, the shikarees made straight for the spot where they had, the night before, carefully deposited the gralloch of the markhor. They rather unwillingly informed me, with the utmost gravity, that they were going to search for the said stone, which, amongst other properties they believed it possessed, was that of its being an infallible antidote to the poison of snake-bite if applied to the wound. Whether they found this talisman or not I failed to discover—and in all probability, had they done so, they would have kept it “dark,” for fear of my depriving them of it.

As we proceeded upward we started a musk-deer, at which I was very nearly “letting loose,” and glad I was that she escaped, for on getting up to the bed from which she had risen, we found her suckling offspring lying on it. After following far on the tracks of our friends of the previous evening, seeing nothing but a few does with kids at foot, we returned to camp, which had been brought up during the day.

It now seemed as though the good luck we had hitherto enjoyed were about to desert us, for the last day we spent on this ground was fraught with “grief.”

Early in the day, as we were clambering across a break-neck place, I was startled at hearing a sharp exclamation, as if caused by pain, from Hatha, who was following at a short distance behind. In climbing along the rugged face of the steep slope we were traversing, he had in some way managed to wrench his shoulder, which, being weak from former dislocations, had now slipped out again. As he

¹ *Bezoar*, a calculous concretion sometimes found in the stomach of certain animals of the goat tribe. The term comes from a Persian word meaning antidote, which this substance was absurdly supposed to be, and is still by Orientals, to the fatal effects of poison.

objected to the rough treatment adopted in my case, there was nothing for it but to sling up his arm with a turban and return to camp. The poor fellow bore the pain he must have suffered during our long and rough trudge most pluckily. On reaching the tents, my cook, in whose surgical skill he placed more confidence than in mine, at once took him in hand, and, aided by the patient's own directions, soon replaced the dislocated joint.

As the day was still young, I proposed to Gamoo that we should take a turn in an adjacent birch wood, on the chance of finding a musk-deer or a bear. Hatha, who seemed quite hurt at the idea of being left behind on account of his mishap, insisted on accompanying us. Thinking there would be little or no chance of seeing markhor in the direction we were going, I took with me only the short double rifle, as being more handy than the long Henry in the event of getting a snap-shot at anything in the wood.

After beating through the wood, we emerged on to a gently sloping bed of hard snow, about a hundred yards broad, that extended far up between steep, rugged, and partially pine-clad acclivities, until it terminated among a wilderness of bald grey rocks and huge snow-capped crags that towered aloft at its head. Although the sun had sunk behind the high sky-line of the mountains, it was still early to turn our steps campwards; so I suggested a stroll up this long stretch of snow, in the hope of meeting with some old bruin out for his evening promenade.

We sauntered carelessly along for some time, taking an occasional glance up towards the wooded slopes and crags on either side, when, with a suppressed exclamation, down crouches Gamoo on the snow, and in a second Hatha, Sultana, and myself are prostrate beside him. Not a syllable is spoken as we crawl on all-fours over the snow-bed, until we get close under the steep hillside rising from its margin, when Gamoo points in the direction of the grey rocks ahead, and whispers "Markhor!"

As the rocks are a long way off, I am unable at first to make out what Gamoo's keen sight has detected; but at length my eye rests upon a motionless V., which, even far away as it is, looks gigantic. I am afraid, however, from the jabbering whispers and doubtful glances that are exchanged between my companions, that they are rather perturbed in mind as to the issue of the business. On the spy-glass being put into requisition, it shows me that their anticipations are likely to be verified, for I distinctly see that the beast is gazing straight in our direction; but it also shows two others, quite as large as himself, that are browsing unconcernedly in his vicinity.

We lie silently watching him for what seems to my impatient imagination an endless time, as he remains standing there as still as the rocks around him. At length he turns slowly about and is lost to view; but he soon reappears walking leisurely across the snow-bed, his companions following at short intervals, until they all are hidden behind a high projecting crag. Our only chance—and a poor one it is—lies in our being able to reach that crag in time for a long shot as they ascend the hillside beyond it; for although their movements appear slow, they are evidently on the alert, and in all probability will not stop again until they reach some distant sanctuary.

Up we jump, and set off at our best pace along the snowy incline. It looks easy enough to travel over, but we get dreadfully "pumped," for the more rarefied air at this height—at least 12,000 feet—soon begins to tell on our wind. At last, panting and almost broken-hearted, we reach the crag. There is no time to wait for breath, as two of the markhor that are still in sight are just about to move over a brow nearly two hundred yards above us. Oh that I had the long Henry with me now! for I have not much faith in the short double rifle at such a distance. With my chest heaving, and my pulses throbbing as if ready to burst, I thrust my alpenstock into the snow to

form a rest—for my arm is still weak—and taking a hasty aim, fire, and of course miss.

Alas for that useless random shot! which I shall never cease to regret, although I have often since profited by the lesson it taught me.

Hardly has it left the barrel when there is a tremendous clatter close above us, as the third markhor, which we imagined had preceded his companions over the brow, starts wildly up from where he has been standing unnoticed in the deep shade of the crag behind which we have approached. So utterly astounded am I at this unexpected apparition, that I actually miss the monster at about eighty yards distant, as, with his splendid horns thrown backward, he springs nimbly up from rock to rock until he vanishes with a bound over a ridge rising just above the crag.

Here was a nice mess I had made from firing that long random shot; and how often are good chances thus stupidly lost! But "there is no use crying over spilt milk," so we climbed up to examine the spot where the buck was when I shot at him. He must have had a very close shave, for there lay a lock of his long beard, which had evidently been cut off by the bullet. We followed him over the ridge and down into another deep valley, where his tracks led across a steep snow-bed, on which, had he been wounded, we could not have failed to find traces of blood, however small; besides, it was now getting late, and we were a considerable distance from camp, so with much reluctance and regret we gave him up as lost.

Gamoo, lively under any circumstances, now proposed a glissade down the snow-bed, as our way home led in that direction. So we had soon almost forgotten, for the time, our disappointment as we all went sliding, and I being less expert at it, as often rolling, down the steep slope, much to the amusement of my companions, who shouted with laughter, in which I heartily joined. The shock to my nerves,

once experienced on beholding this easy and rapid method of descending a steep snow-field, I shall never forget. I was hunting ibex at the time on the mountains north of the Sind river in Cashmere. One day, when shifting our ground, we had to traverse a long sloping *arête* of snow, the crest of which was so sharp and hard that we had at times to cut steps for considerable distances. Smooth snow-fields extended down on either side for fully a thousand feet, and sometimes at an angle of considerably less than 45° . After a long and tiresome descent, my shikarees and I sat down to rest ourselves, and to wait for our laden followers, who, as we watched them coming

A Glissade.

slowly along the ridge, looked in the distance like small black dots moving on the sky-line of snow. A sudden exclamation of horror escaped me, which rather startled my

companions, as I saw the leading man come tumbling, as I thought, down what seemed, from where we sat, to be an almost perpendicular wall of snow. My horror was mingled with astonishment at seeing another and then another man follow the first, until all had slid down to where the snow was less steep below, from whence they leisurely continued their descent, when it at once struck me what a mistake I had made in my unpleasant surmises.

We moved next day to another locality, but fortune's favours had departed with those three big bucks. Such extraordinary luck in seeing, in so short a time, so many large markhor, which are usually very difficult to find, could not possibly last; and during the several days we continued to hunt for them, not another pair of good horns did we see.

It was with much regret that, at the termination of this short but satisfactory trip, I bade adieu to the shikarees and others that had served me so well on the mountains, and amongst them Kazima, who had turned out such a good fellow, and had made himself so generally useful. He had now entirely dropped his grand airs, and on being discharged had not even conceit enough left in him to ask for a testimonial as to his sporting qualifications. A short time after, when encamped in the Cashmere valley, I observed coming along the path which passed my tent a stalwart, sportingly-got-up individual, with a pair of markhor horns hanging from the mountain-pole he carried over his shoulder. As he drew near I was delighted to find it was my friend Kazima, and the horns were the identical ones he had picked up when with me on the Pir. As he had not as yet succeeded in "sticking" any one with them, he bore them as an emblem of his would-be calling. The pleasure of meeting seemed mutual, for on recognising me he ran forward as if about to embrace me, and pulling out a scrap of paper, exclaimed, "See what I've got since I left your service!" Taking the paper,

I read: "The bearer of this, Kazima, has shown me a number of bears, and I can highly recommend him as a capital shikaree,"—to which was appended the signature of the fortunate man with whom our friend had been shooting bears among the groves of wild fruit-trees in the vale. When I had finished reading, he covered his face with his hands and laughed immoderately. It was the first shikar testimonial he had ever got. He informed me he was then on his way to Baramoola to try and pick up another sahib of the same sort as his last employer. I wished him good luck as he went on his way rejoicing.

Several years after, I chanced to meet him again in Srinuggur, looking a mightier swell than ever. He was then in service as a shikaree, and begged me not to divulge his antecedents in that line. His gratitude was freely expressed when I told the good fellow there was little chance of my so doing, and all the less since, for aught I knew, he might now have become quite a proficient in the art of venery.

CHAPTER XV.

SHOULD the following account of the pursuit of the "hangul," or Cashmere stag, chance to meet the eye of any one who, like Leech's "Mr Briggs," has been "made free" of a Scottish deer-forest, he may contend that stag-shooting in Cashmere is inferior to deer-stalking in the Highlands. Well, in point of numbers he is perhaps right. But he must take into consideration that a forest in the Himalayas is very different from a forest in the Grampians. The former is a *true forest* in every sense of the word, where the deer are at all seasons liable to be disturbed by beasts of prey as well as by hunters, and where, in its vast wooded depths, they are often very difficult to find; whereas the latter, as is well known, is nowadays usually one only in name, so far as trees are concerned, where the cervine denizens, from being tended, as it may almost be called, for the greater part of the year, and sometimes even fenced in, like domestic cattle, to prevent them from straying, are consequently more numerous and less really wild, though during the stalking season they become just as crafty as their *confrères* of Cashmere. But to the keen sportsman and lover of nature the pursuit of the noble Cashmere stag in wilds where its protection from constant danger depends entirely on its own instinct, the grand and varied character of the mountains, the perfection of climate, the superiority of the trophies,¹ and, last but not

¹ Few deer, if any, except the wapiti of North America, carry finer horns than the hangul, and hunting the "elk" (as it is termed) in the Rockies, I

least, there being no "march" beyond which the stalker cannot follow his quarry, are all charms which more than compensate for want of numbers, and make hangul-shooting in Cashmere the poetry of Himalayan, or, I may venture to say, of any other *mountain* hunting.

Far be it from me, however, even to hint that Highland deer-*stalking* is not right royal sport. In fact, the Highland stag, from the open nature of the ground he usually frequents, requires more skill in stalking than does the Cashmere hangul. Still, there is not the same romantic charm about the pursuit of game that has been preserved, as there is when you know it is in every way wild; and in this I feel sure all real sportsmen, both at home and abroad, will agree with me. Indeed, for my own part, I much prefer circumventing a few wary old black-cocks in a day's walk over a bit of wild ground, to standing at the hottest corner of a preserve, even were I an adept at pulling down the rocketers, which I am not; for much rifle-shooting is not conducive to improving one's form at such sharp practice as that. But tastes differ.

In the autumn of 1866, our regimental Æsculapius, after carefully attending me through a severe bout of illness, succeeded in persuading the ruling military powers that my return to the sunny plains of India from sick-leave to "the hills north of Dehra"—as the *mightiest of mountain-ranges* was then styled in official parlance—would be unadvisable before the end of November. Thus an opportunity was afforded me of hunting the Cashmere stag at the best season for finding him—the month of October and early in November.

Here I can quite imagine the fortunate holder of a Scottish deer-forest exclaiming—"Shoot stags so late in the season! What a poacher!" But I would crave his patience whilst I

found to be, during the "running" season, very similar to hangul-shooting in the Himalayas; but the ground is much steeper in the latter mountains than in the former.

further explain to him that I once hunted indefatigably after hangul from about the middle of August until towards the end of September, over what was considered to be excellent ground, but, owing to the denseness of the undergrowth, without so much as seeing a single stag, even in velvet; and the constant rain and mists at that season were very detrimental to this kind of work. A circumstance over which I had no control—namely, the termination of my leave—obliged me then to quit Cashmere, just as the deer were beginning to rut, which is the only time that there is any certainty of finding stags, except when the winter snow drives them down almost into the valleys. During the rutting season they betray their whereabouts in the dense tracts of forest they affect, by their intermittent roarings¹—strangely wild sounds which, when once heard echoing through those grand pine-woods, continue to haunt the ear for many a day. At that season, too, the gallantry of the stags in escorting the hinds from out the thick forest on to the open green slopes and glades, where they are wont to feed morning and evening, and their inclination, at that season, for a roll in their soiling-pools, which are well known to the hunter, often cost them their lives. Moreover, the weather and climate there in October and November are simply perfect.

At the capital I found old Ramzan awaiting my arrival. He looked more snuffy than ever, but was otherwise little altered by an increase of several years to his already advanced age. He proposed that we should try the forests on the hills above Noubog Nye—which beautiful valley I have attempted to describe in a preceding chapter—although the general idea at that time was, that stags had become very scarce there. This, however, turned out to be one of the popular fallacies respecting the great decrease of all Hima-

¹ Whistling is the term applied to much the same noise made by the wapiti stag of North America; but something between a prolonged roar and a whistle perhaps gives a better idea of the sound.

layan large game. When I say this, I do not include the game in the more easily accessible localities, such as the Dehra Doon forests and parts of the Terai, where, from the indiscriminate slaughter of milk-hinds and calves, which are so often butchered from howdahs by those who call it *sport*, the decrease of game is a sad truth: I mean the animals on the higher and less accessible ranges. The real fact at that time was, that in the Nouboug forests, owing to the late grazing of the sheep there, the stags did not descend from their summer haunts on the higher mountains so early as was their wont in many other places—in fact, not before the time of year when the majority of sportsmen were, in those days, obliged to quit Cashmere. I therefore resolved to abide by the old man's decision, and had no reason afterwards to repent having done so.

The Cashmere stag (*Cervus Wallichii*), or hangul, as he is named in his own country, requires but little description, further than that he is merely an exaggerated red-deer stag. The horns of this noble animal are larger than those of any other Himalayan deer, except perhaps the "shou" or Sikim stag (*Cervus affinis*), which is found in some of the south-eastern parts of the Himalayan range; but I have never seen him. In weight I should say, at a rough guess, the hangul must be from 25 to 30 stone clean. Like the ibex and other large game of the higher Himalayas, he is provided during winter with an undercoat of the very fine and soft pile known as "pushum." I have seen a set of horns with seventeen well-defined points; but the usual number on a well-developed pair is from ten to twelve, those with ten often being more massive than those having a greater number. The three upper tines, or royals, are not so closely set together at their base, or "cupped," as it is commonly termed, as those of red-deer, and the beam is usually more curved. The hind is called "minnyemer" by the Cashmerees, the word "mooc" being applied by them to these deer collectively. This animal is customarily talked of as

the "bārāsingha" (twelve-horned), which designation, as also "burrasingha" (large-horned), is given promiscuously by Europeans as well as by natives to all varieties of large-horned *deer* in India, but never by natives when they speak of them among themselves, only when describing them to foreigners. From this I conclude that the misnomer was originally coined by those who were unacquainted with their true local appellation, and thence adopted by shikarees and others for the large-horned Indian *deer* in general, though for none in particular. I have even heard the jurrow or sambur, which carries only six regular points, called a bārāsingha. But we will now proceed to the resort of this splendid brute, where I hope we may become better acquainted with him.

Our headquarters were at first established near the hamlet of Nouboog. It was rather early for the ground in that neighbourhood, very few stags having, up to that time, found their way down from their summer quarters on the higher ranges—for the lower woods were still full of tormenting flies, and the shepherds with their flocks had not as yet left the open pasturages above the forests. Other sportsmen, too, were at present in possession of the best shooting localities farther up the glen. The distant bellow of a stag was occasionally heard towards evening on some neighbouring hill. But on our reaching the spot where we hoped to have found the animal that had spoken, his voice would tell us that he had travelled far away to some other part of the dark forest. On such occasions Ramzan was wont to give vent to his disappointment by heaping abusive epithets on the innocent animal and its relatives, and expectorating towards it.

On one of the shooting-grounds farther up the "nye" (glen) being vacated by its occupant, we left our depot of supplies at Nouboog, and at once took his place—for we learnt that he had been but a short time there, and had not much disturbed the deer.

In order to avoid the trouble and delay entailed by the

long climb each morning before reaching our ground, arrangements were made for sleeping out for a few nights high up in the forest, and that evening we found a snug resting-place under shelter of a big pine-tree in a deep sequestered gorge. The "roaring" of stags was now pretty often heard, but only in the thickest parts of the dense forest, where it was almost impossible to get even a glimpse of the animals that spoke. Nothing was seen except two brown bears, which were left unmolested, from fear of disturbing the deer, until the third day.

It was our intention, on the evening of that day, to return to our camp, with a view to again changing our ground. In the afternoon, during our descent, we found ourselves on a broad and gently sloping spur, on one side of which was a steep-sloping, fern-covered glade—on the other a dense pine-wood. Here we found the tracks as fresh as they were numerous, and the beds in the long grass and brackens looked as though the deer had but recently risen from them. As we had, earlier in the day, heard a stag bellowing far down in the neighbouring forest, we determined to watch the glade from among the long brackens on the outskirts of the cover, in hopes of his taking an airing there in the evening.

The tall black pines were casting their long-pointed shadows over the glade as the sun sank slowly behind them. Still and silent we sat there, keeping vigilant watch, and intently listening for the note of a stag. At last comes the wild and welcome music floating faintly up through the forest. Louder and more harsh grows each repetition of the strain as it draws nearer and nearer, until there is no doubt of its being the animal's intention to visit the glade. Presently a hind comes tripping warily from out the wood. She is almost immediately followed by several others, until at last forth stalks a mighty stag wearing a splendid crown of horn. The hinds soon begin listlessly cropping the grass. They are jealously waited upon by their lord, who, with swelling throat and bristling neck, continues to bellow forth,

at intervals, his love-song to his harem, his appetite being apparently much affected by his amours. Although comparatively close, he is much too far from our present position to risk a shot at him whilst there is a possibility of getting nearer. How my heart throbs between hope of a chance and fear lest I may lose it, as we worm ourselves along through the brackens towards the wood, and, on gaining it, creep stealthily on among the bushes towards our noble quarry! There are some who may say that an old sportsman should never get excited. To put it plainly, this is what is vulgarly called "gammon," or more politely, contrary to human nature. When the pulses cease to quicken at the prospect of bringing down a grand beast, slaying him in cold blood can no longer be called sport. The keener the sportsman the more intense his excitement, although experience may have taught him to keep it under control. But this is no time for moralising.

At last we get within easy range of the stag, now standing forth alone, snuffing the tainted air as though he had some inkling of danger. But little he recks of its being so near him as he stands there, his royal head held proudly erect, looking quite the "monarch of all he surveys." The bead-sight is on his broad shoulder; yet so fearful am I of missing him, large and near though he is, that I hesitate for some time before pressing the trigger. Off goes the shot at last, but, to my intense surprise and concern, without the slightest apparent effect on the stag. For a few seconds he stands stock-still, and then with a bound starts down the steep declivity in front of him. Oh the agony of that moment! Fortunately for me, however, he has taken the open instead of the wooded side of the spur, thereby giving another chance as he rushes headlong down the hill. By great good luck, the second shot catches him high up in the hind-leg; but he still holds on, with the broken limb dangling loosely about, and disappears among the thick brush-wood below. The track where his wide-splayed hoofs have

ploughed up the ground in his rapid descent is easily followed, and we soon overtake him near the bottom of a steep rocky water-course, where he has lain down. He makes an effort to rise on our approach, but a shot effectually stops his farther progress; and after a considerable amount of dodging to avoid his swaying horns and kicking hoofs, we at last succeed in giving him the *coup de grâce* with all due ceremony.

He was indeed a royal hart in every sense, with wide-spanning horns which measured six and a half inches round the thinnest part of the beam, and such brow, bay, and tray antlers as few stags can show. Yet I hardly deserved to get him, for we found that although the first shot had struck him just behind the shoulder, it was so low down that there was barely an inch to spare. We should certainly have seen the last of him had he not chosen the open instead of the wooded side of the spur for his line of retreat, thereby giving me a chance of spoiling his haunch as I did.

It was too late to make arrangements for carrying away the spoils that evening; so leaving our two spare men to keep up a bonfire for scaring off the bears, which would be certain to sniff the venison, Ramzan and I started for the camp. Night overtook us in the dark forest whilst we had still some way to travel, but our signals of distress were soon answered by our men below, who brought up pine-torches to light us down the hill.

Next day the villagers, who seemed to have scented the meat from afar, flocked to our camp from all directions, like so many vultures.

As the stags were reported to be now pretty constantly heard on the heights above Nouboog, we returned to our old quarters in that direction. During the next two or three days, although stags were frequently heard, nothing with horns was seen, until early one morning the spy-glass was brought to bear upon a solitary fellow carrying a splendid

royal head, and roaring like a bull as he quickly ascended a steep open hill-face before disappearing over the ridge above it. After a hastily despatched meal we started to look up his domain, our blankets and supper being taken with us, as we purposed spending the night on the hill.

A stag, which we thought might perhaps be our friend of the morning, again "tuned his pipes" in the evening, as he moved up through the forest towards the open ridge above it. At length he made his appearance, but only when it had grown so dark that we were unable to recognise the shape of his horns as he stood bellowing there within what, in daylight, would have been easy range. As we saw nothing more of the beast after my random shot at him in the dim uncertain light, I scored what I might only have expected—a miss! Several distant stags began roaring in different directions as we sadly took our way to where we intended passing the night under shelter of a pine-tree; so I consoled myself with the knowledge that, like the fishes in the sea, there were still as good deer in the forest as ever came out of it.

Feeling pretty certain that in the morning we should find one of these noisy fellows out on some open hill-top in our neighbourhood, we were afoot very early. Fresh tracks were numerous, but not a stag did we see, nor did a bellow break the silence of the forest. After our morning meal we went out again and followed up, for some distance, the track of the stag I had shot at on the previous evening, but finding no blood on it confirmed my idea that I had correctly scored a miss. The prospect of sport on this ground seemed so good that we determined to remain where we were for a day or two longer.

That afternoon we tried the hill-tops that overlook the Cashmere valley. Towards evening we took up a position behind a green knowe, whence we could watch a tolerable extent of open ground, and listen for deer in the forest which bordered it. It had also the advantage of com-

manding an extensive view of "the vale," lying some 2000 feet below. Even my native companions seemed impressed with the exquisite loveliness of the prospect; for the Cashmeree, although small-minded in many ways, still has in his soul a spice of romantic admiration for his beautiful fatherland. At the foot of the range we were on lay the dreary, treeless plateau, where, in the centre, stands the massive old ruin of the Temple of the Sun—"Martund"¹—lonely and grand; whilst far beyond it, and all smiling in the mellow evening sunlight, stretched the broad green vale away towards the distant mountains rising blue and snow-capped

Ruins of the Temple of the Sun—"Martund."

on either side, its tortuous streams winding along like shimmering threads of gold until lost in the gauzy haze. . . . "Grrō-ō-ō-ō-ā-oo-ooā," nasally, with variations and *cadenza ad libitum*, goes a stag in the forest behind us,

¹ This noble old structure—by the natives called "Pandoo lurrie" (Pandoo house)—is, I believe—like the ancient ruins I have mentioned as situated between Uri and Baramoola, which, on a larger scale, it somewhat resembles—of doubtful origin. From the symbolical figures it contains, it is, however, pretty certain that it was at one period dedicated to the worship of the Hindu triad—Brahma, Vishnu, and Siva. A noteworthy feature of its architecture is the keystone of the arches, which is formed of a solid T-shaped block, such as I have endeavoured to depict in my little sketch of this ruin.

rudely interrupting our reveries. He is not very far off either, and Ramzan says there is just a chance of the animal's coming to have an evening roll in a small muddy pool, or "trag" as it is here called, that he (Ramzan) knows of in the vicinity.

We soon reach the pool, which is situated near the border of an undulating grassy glade immediately above the forest where the stag was heard. At the edge of an opposite wood, and about a hundred yards from the pool, Ramzan selects a spot for an ambush, which merely consists of a few green branches stuck into the ground; but our view of the pool is quite obstructed by some rising ground on our side of it. This flaw in the position cannot, however, be avoided, owing to the direction of the wind; and Ramzan, from former experience, confidently predicts that the hangul, if he should visit the trag, will, after quitting it, be pretty certain to show himself on the said rising ground. The old man seems so satisfied of his conjecture proving right, that he goes so far as to divest his head of its big white turban—a precaution which he seldom thinks necessary in close country unless he really means business.

The bellowing, although now much nearer, is only heard at long intervals, until at last such a time elapses without its being repeated that my hopes of a chance are fast subsiding. But listen! a low sort of groaning sound comes from the direction of the pool. Again we hear it, this time in short subdued grunts, and there is no longer any doubt about its proceeding from the stag as he wallows in the mud, although we cannot see him owing to the rising ground that intervenes. My companion, as he sits silently by, exhorts my patience by intelligent glances, as I anxiously await the issue of the business. We have not long to wait, however, before a pair of broad-spreading horns with ten beautiful tines rise gradually over the grass, until at length their owner, all soiled with wet mud and quite unconscious of danger, stands in full view before us. A few seconds

more and he is stretched on the grass, kicking furiously in his death-throes.

Dropping the beast on the spot was indeed a bit of rare luck, and was accounted for by a splinter of the shell, which struck him rather high behind the shoulder, injuring his spine. I only give my good old shikaree his just due when I say that getting a shot at this beast was entirely owing to the thorough knowledge of his calling he possessed. I have sometimes met sportsmen in India who affect to scorn the assistance and advice of a native stalker. But in doing so I think they are mistaken; for with their limited knowledge of the ground it stands to reason that they cannot work it with the same advantage as the native shikaree who has known all its features and peculiarities since his youth. I have known others who imagine they can walk down the paharee in his native mountains. With his oriental politeness he may flatter them into such a belief; but given any distance from five miles to a hundred over a rough mountainous country, with a good reward for the hill-villager at the end of it, and then see who will win the race—the bare-footed, agile mountaineer, or his white competitor, however athletic, in his boots?—the paharee, and even a very ordinary one, “I guess.” Few shikarees are, however, of much use to an experienced hand except in their native neighbourhood.

My satisfaction, as I stood admiring the grand proportions of the fallen stag, was slightly mingled with remorse when I thought of the rather mean advantage we had taken of the unsuspecting animal in our method of circumventing him. The beam of his horns was only $5\frac{1}{2}$ inches in girth, but this was compensated for by a span of 33 inches within the bend. We bled and gralloched him then and there; but as darkness was fast setting in, we left two men to guard him at night from those hirsute thieves the bears.

During the night I was awakened by the hoarse bellowing of a stag in the direction of a trag on an open spot

within a quarter of a mile of where I lay. This time it must have been more of a challenge than a serenade, for it soon called forth a loud response in the echoing wood from a rival forest king, who seemed to draw nearer the challenger until their voices suddenly ceased. From this I divined that the rivals were fighting it out on the grassy arena beside the pool. Darkness, however, prevented my interference with their quarrel.

Early next morning one of the watchers came and reported that during the night another hangul had actually come and rolled in the mud beside the pond, within about twenty yards of which the dead one was lying. This sounded rather improbable; but, as I intended hunting again in that direction, I resolved to go and examine the place myself. There, sure enough, was the fresh impression where a second stag had rolled in the wet mud and had left some of his hair sticking to it. Of one thing there was no doubt—both the watchers must have fallen asleep and let their fire go out, although they stoutly denied having done so.

These ponds or "trags" are used by the herdsmen for watering their cattle when up grazing on the hill-tops. They are always favourite resorts of the stags for soiling themselves in during the rutting season, when the animals become very restless, and often so reckless that when following a stag in thick forest you may sometimes even attract him towards you by breaking a dry twig, the slight noise of which the stupid beast, in his love-sick imagination, supposes may be caused by a hind.

Shortly after leaving the pond, a hangul raised his voice in a thick pine-wood below us; so we determined to try and follow him up there, for it was too late in the morning to expect him to show himself outside it. As the roaring was not continued, we adopted the following plan: after carefully testing the wind in the usual manner, by tossing up scraps of dry grass, Ramzan and I moved stealthily

towards the place where the bellowing was last heard; whilst the other two men of our party made a wide circuit below to search for tracks, should the deer have moved downwards. Each time we stopped to listen, the twig-breaking trick was tried, but with no effect. On reaching the supposed position of the deer, not a trace of any sort could we find to direct us, when "too-who," "too-who-oo," comes the hoot of an owl from among the dense dark pines some distance lower down. This time, however, it proceeds from no bird of ill omen, for in it we recognise a preconcerted signal from the men below for calling us down to them. It is at once answered by a like sound, made by blowing between the hands clasped together in a certain way, and is repeated at intervals until we find our scouts. They have ascertained by the tracks that the stag has moved downwards in company with several hinds. Keeping well on the alert for any movement in the brushwood, we follow cautiously on the broad trail. Suddenly a stampede is heard, and we get a momentary glimpse through the trees of one or two of the brown hides vanishing into a dell a short way ahead. As the animals have become alarmed, our only plan now is to run forward to the place where they disappeared, on the chance of getting a snap-shot ere they get too far beyond it. Fortune is so far kind, for on our reaching the desired spot, all breathless from running, I catch sight of one of them—a stag, and a good one too—through a vista in the trees, as he stands looking back within easy range below me. The hanging smoke prevents my seeing the effect of the shot, but the sound of the striking bullet seems to denote meat. "He's down!" breathlessly exclaims Ramzan, as he feels for his knife. But this remark is succeeded by a much less exultant one. "No, he's up and away again! Oho! tzh! tzh! tzh!"—usual interjections of disappointment made with the tongue and teeth. No venison, however, do we find on going to look for it, although my old companion positively declares to having

seen the animal on the ground, toes up, after the shot. All attempts at following the tracks for any distance are frustrated by numerous fresh and large ones here leading in all directions, and there is no blood to guide us. So I turn my steps campwards lamenting, followed by Ramzan and the other Cashmerees "tzh! tzh! tzhing" in the most aggravating manner all the way.

Again the villagers flocked up from below to our bivouac, where they gorged themselves and wrangled over the distribution of the meat until late in the afternoon, when we packed up and started for the tents below.

As we were descending in the gloaming, some hinds, followed by a stag with longish prongs, moved past us across a glade. Several rounds of ammunition were expended, only one apparently with effect, and that probably slight. Anyway, we failed to find the beast when we returned next morning to search for him. My spleen at losing him, which was considerably augmented by my having bad toothache, was vented on an unfortunate flying squirrel, whose abode in a dead pine-tree we chanced to come across as we were returning, and out of which we "scraped" him.

The camp was again shifted to a fresh locality farther up the glen. The fine weather we had hitherto enjoyed was now exchanged for wet and cold, which so increased my toothache that I could get no rest. Ramzan suggested that he should fetch a barber of his acquaintance, who, he said, had frequently operated on him under similar circumstances. This village practitioner was accordingly called in and consulted. Smiling blandly, he produced a barbarous implement about a foot long, and not unlike a very rusty old pair of carpenter's pincers, with a hook at the end of one of its handles to prevent the operator's hand from slipping. Even the sight of this terrible instrument failed to have the usual temporary effect of allaying the distracting pain; so I was forced to place my jawbone at the mercy of the hair-dresser, who, with the most cold-

blooded indifference for my feelings, began deliberately washing his diabolical-looking forceps in a stream directly in front of my tent door, thereby hinting that he was quite ready to operate forthwith. After putting me to a protracted amount of torture, during which old Ramzan was praying audibly and devoutly behind me as he insisted on holding my head, the operator at length, to my infinite relief, both of body and mind, succeeded in extracting the proper tooth without fracturing my jaw. This, however, was not the end of it. The excited dentist straightway dashed pincers, tooth and all, to the ground, and, energetically aided by Ramzan, frantically set to shampooing and "thrawing" my head to such a degree as to almost threaten my neck with dislocation, each of them accompanying their combined exertions with "Yah Peer! Yah Russool!" and suchlike hurriedly repeated pious expressions, until I at last managed to free myself from their tender mercies. A fee of a few "chilkees" (Cashmere silver coins worth about a shilling) sent the barber-surgeon home rejoicing.

CHAPTER XVI.

ALL Nature's charms looked more bright and beautiful when the clouds cleared away after two or three days of almost incessant rain, and we again took the hill. In the afternoon, after a long ascent from the camp, we sat down to rest among the brackens on a steep spur, and just outside a dense pine-forest that clothed its northern slope. Several stags were bellowing away in a thickly wooded gorge far below. As we sat there consulting as to how we should try to circumvent one of them, a shaggy-looking animal suddenly bounced out from the wood on to the open ridge, some 150 yards higher up than where we were sitting, and after a few bounds downwards, again vanished into the wood. We were all quite nonplussed as to what it could have been, for it certainly was not a deer, and it had neither the gait nor the colour of a bear. Whilst we were discussing the matter, a rustle was heard in the wood behind us. On looking round, to our utter amazement there we saw the long black visage of a tahr—not a surrow (termed "rāmoō" in Cashmere), which is sometimes in the more eastern Himalayas called tahr or "thār," but a veritable tahr. He was standing among the brushwood within twenty yards, and returning our gaze with apparently equal astonishment to our own. Snatching up the rifle, I blazed straight at him, letting him have the second barrel as he rushed away through the bushes. Being sorely wounded, he was soon overtaken, when another

bullet finished him. He was a fine, dark, shaggy buck with good horns, and about the last animal we might have expected to see on such ground, where his appearance was most unaccountable, for there were no tahr haunts within at least thirty miles of it. Ramzan told me that he remembered only once before having seen a "krās," as he called him, on the Nouboog hills. This one was evidently a stranger in the land, and might perhaps have been chased from his own rocky fastnesses by wild dogs. It was the rutting season, however, and love is sometimes the cause of strange freaks. After hunting here for a day or two without firing a shot, we moved camp towards the head of the Nouboog glen, whence the shepherds with their flocks had now descended from the higher pasturages.

The following afternoon, when we were far up on the hill, ragged fragments of mist began to circle and toss wildly about the mountain-tops, and snowflakes soon commenced drifting thickly and rapidly past us; so we sheltered under the lee of some blocks of rock in a little birch coppice. How we shivered with cold as the bleak chilling blast whistled drearily through the birches and whirled away their withered leaves before it! For several hours we sat dolefully there, crouching over a little spark of fire, for we dared not light a bigger one lest the smoke should alarm the deer. I had not even the solace of my pipe, which I had stupidly forgotten to bring with me; so I had recourse to Ramzan's snuff-box as a substitute for a smoke. It was still snowing, and the lessening light warned us that it was time to be moving downwards, when just then our drooping spirits were raised by the welcome voice of a stag on an opposite hillside. The fire, to which we had been gradually adding fuel as we grew colder, was instantly "doused." Exercise and excitement, however, soon warmed us up, and by the time we neared the place where the stag had last been heard, it had almost ceased snowing. But the dusk was fast closing in, and had it not been for the fresh-fallen snow,

on which we could distinctly pick up the stag's slot, we should soon have lost the track. Moreover, the beast was evidently now travelling pretty fast and roaring very seldom.

We had tracked through a dark strip of pine-wood, and were about to emerge on to an open undulating bit of grass beyond it, when we caught sight of the stag standing there some distance ahead. I was very anxious to "loose" at him, for the light was fast fading; but as he had again resumed his roaring at pretty regular intervals, Ramzan suggested that we should try to get closer. Quickly we made a circuit through some cover, and contrived to come up with the animal as he stood for a few moments within some eighty yards, slightly below us, and broadside on. But, alas! the short Indian twilight had now failed us, and I could no longer see the fore-sight of the rifle, for, unfortunately, it was not silvered, as the near end of the sporting fore-sight should always be; so I took the best aim I could at the shadowy form of the stag without it. The bullet told on him somewhere with a smart "thwack,"—a term, I think, better suited to the sound than the conventional "thud," which as often denotes *mud* as meat. The deer gave a sudden spring, turned short round, and plunging down the hill, disappeared in a deep wooded gorge. To follow him in the dark would have been worse than useless; we therefore made the best of a long trudge back to camp. Fortunately the clouds had broken, so we had some glimpses of moonlight to help us through the gloomy pine-woods.

At peep of dawn we were off again, and spent several hours in trying to follow up the stag of the previous evening, as we felt certain he was hard hit. There was no blood on his track; but this might have been accounted for by the closing up of the small orifice made by a .450 bullet, or by the shell hitting high in the animal's body, and bursting up without penetrating right through it. Ramzan, who was rather conservative in his ideas, had already suggested that the new-fangled "nasala ke golee" (medicine-bullet), as he

termed my vaunted shell, might not be very certain in its effect, and I was beginning to think he was right.

The cold at night had become so bitter up here that the camp was moved to a warmer locality below. The stags, too, had apparently gone lower down, for they were now less often heard high up. We resolved, however, to take another turn over the higher ground before descending in the evening to our new quarters. Our breakfasts had been discussed, and we were all lounging lazily on a wooded spur when Ramzan, who was always on the alert, said he thought he heard a hangul calling far away up on the hill above. So long a time elapsed without a repetition of the sound, that I thought he must have been mistaken. "Hark! there he is again," says the old man, as this time the wild cadence, mellowed by distance, comes distinctly over the hill behind us. As the ground above is pretty open, the chances of a stalk are in our favour, so we at once commence working upwards. After a long and stiff pull we reach a ridge overlooking a deep sort of corrie full of dense brushwood, from whence the bellowing now comes repeatedly in hoarse volumes. After intently listening for some time, Ramzan gives his opinion that, judging from the approaching sound and the direction of the wind, the beast will very likely cross the open hill-face below us. No sooner has he given vent to his prediction than another lusty roar comes from almost directly below, and the long, white-tipped, upper tines of the stag appear moving among the brushwood in the hollow. Onward they slowly come, until the mightiest stag we have yet seen is leisurely walking across an open slope below us, and within eighty yards. There is not much time for a steady aim, as in a few seconds he will again be out of sight. Feeling certain that the shoulder of a brute the size of an ox can hardly be missed at so short a range, I confidently let drive at him. He seems to half-stumble on faster for a few steps, and then resuming his original pace, slowly disappears behind some high bushes.

“Come this way, quick!” says Ramzan, starting off at a run; “he’ll cross the ridge lower down, as he’s making for the wood behind it.” There is no stopping to recharge the empty barrel of my muzzle-loader, for we have only just time to run down the ridge and head the animal before the white tips of his horns are again in sight. How I gloat on those massive, wide-spreading beams and twelve long tines as they draw nearer and nearer! I fancy I can see those antlers now, as I write, swaying to and fro, as the seemingly wounded stag labours slowly up the hillside, until he is actually within fifty yards of where we are crouching low among the tall ferns. As I put up the rifle nothing is to be seen before its sights but a broad brown shoulder; and from the fact of there being only space for at least a mile beyond the deer, the loud smack made by the shell cannot possibly have told on anything but him. On receiving the shot he stops short, turns his head slowly towards us, and after standing for a few seconds steadfastly gazing at us, continues his course at a canter towards the ridge, and crossing it just below us, disappears into the wood beyond it, exactly as my crafty old companion had foretold.

“There’s not such another hangul in all these forests,” says Ramzan hurriedly, as he impatiently assists me to reload. “He’s badly wounded, so we’re sure to come up with him in the wood.” Never before have I seen the old man so excited, and I feel quite confident myself that the stag is mine. But, alas! we are both mistaken this time. Although we follow the track until evening, never again do we set eyes on that monarch of the forest after his clearing the ridge.

It was some time ere I could realise the sad fact that I had lost this splendid brute. I now came to the conclusion either that the hardened detonating shell must have burst to pieces in the thick muscles of the shoulder without penetrating farther, or that the whole thing was an optical

delusion. At any rate that stag must have borne a charmed life, for, as he stood looking at us after the rifle was empty—wae's me! it was only an old muzzle-loader—my gun, loaded with honest leaden bullets, was within arm's reach. But its carrier, who I had no idea was crouching quite close behind me, in his excitement had forgotten to hand it to me.

My frame of mind, as I plodded wearily down through the dark pine-woods, was decidedly grumpy. For the best part of two days did we perseveringly search for the wounded stag, with only the doubtful satisfaction of finding here and there a few drops of blood on the trail. Fancy is often apt to picture the trophies one loses as the finest, but those magnificent lost antlers haunt my memory to the present day.

The moon being now near its full, Ramzan proposed that we should try watching beside one of the trags that was most resorted to by the stags. We therefore shifted our quarters back to the vicinity of the pool where, several nights before, I had imagined the tournament had taken place. Although this night-watching for stags is rather a "shady" way of doing business, there is certainly a wild charm about it on a calm moonlight night, as the sportsman—or poacher, as he may perhaps be considered—lies in wait, expectant for his quarry, beside some quiet pool, his senses all quickening at the slightest rustle of a leaf in the hushed forest.

The shadows of evening were deepening in the woods when we spread our blankets behind some bushes under the tall sombre pine-trees near the trag we intended watching. As night advanced, the occasional eerie hoot of a great horned owl, or the flit of a flying squirrel among the overhanging branches, where he nibbled the pine-cones, only made the stillness more impressive. Our surroundings, too, became more weird-looking as the rising moon shed a dim ghastly light on the gnarled and crooked stems.

of the silver birch-trees standing here and there like white spectres in the gloomy cloisters of the pine-forest that begirt the pool. Sometimes our flagging hopes would be raised as the far-off bellowing of a stag was intermittently borne towards us on the night breeze that gently rocked the pine-tops, but only again to sink with the sound as it gradually died away in the distance. This was all very romantic and exciting, until towards morning I grew so sleepy that I could no longer keep my eyes or ears open. And when, at grey frosty dawn, we returned, chilled and disappointed, from our night vigils, all my ideas of their romance had evaporated.

For the next two days we hunted unsuccessfully, my only chance being at an old black bear, into which I one evening put a bullet, as he stood up on his hind-legs eating berries off a bush. He dropped quantities of blood, but as his trail led up through thick cover, and darkness was growing apace, we did not think it either prudent or worth our while to follow him far. The fresh-fallen snow, which now lay several inches deep on the open slopes above the forest, had evidently driven the deer lower down; so we moved our camp to the locality where I had shot my first hangul, and for which I had a lingering fancy. If the reader is not already quite tired of following me so often through the forest after stags, perhaps he will accompany me, just once more, in pursuit of one of the grandest of them all.

As we were setting up our camp, an old goojur (herdsman), who was grazing his beasts in the neighbouring woods, volunteered us the information that a very black-looking and big-horned hangul, which for several years had been known to visit this locality late in the rutting season, had, during the last few days, been several times seen about the head of the wooded glen in which he was then herding his cattle. As it was still early in the day, we decided upon at once proceeding in quest of this famous beast. We had

gone about a mile up a burn that flowed through the glen, when we heard a bellow in the wood above us; we therefore sat down and listened. Soon it was repeated, this time lower down in the wood and nearer, as though the stag were about to cross the glen higher up; so we quietly moved on. We had not gone far when I caught sight of a hind a short way ahead. She was crossing the burn, and, from her nervous behaviour, it was evident she had got wind of us. Just then I felt a tug at my coat from the man following behind me, who directed my attention to the head and shoulder of a good stag which was standing, within easy range, among the trees; but before I could cover him with the rifle he was gone. He was a light-coloured stag, and certainly not the beast we wanted to find.

My tent had been pitched close to a corn-stack, in consequence of which I was kept awake almost the whole night by an invasion of rats and mice, that seemed to be amusing themselves by running races over my bed. Next day our search for the black fellow was again unsuccessful, the only thing seen or heard being a stag with short horns, which we "jumped" in the dusky twilight, and I missed.

The following morning we tried the ground where I had killed the first stag, as the one we were now hunting for was supposed to have his present haunt in the dense wood below it. Towards evening we sat down among the tall brackens to watch the edge of the wood from the old spot. After waiting for an hour or more, we were almost startled by a loud bellow, which was soon repeated quite close to us in the wood. Presently a small beast with short prongs emerged from the cover on to the open side of the ridge, where he at once commenced feeding. But I felt quite certain that this was not the animal that had just bellowed so loudly, and as he kept looking back towards the wood, I was equally confident he was not alone. As he fed gradually up towards where we were lying prone among the brackens, Ramzan, who, excellent shikaree though he was, seemed to

prefer a good chance of securing fat venison to the more uncertain one of securing a fine head but rank meat, insisted that this was the animal we had heard, although he must have known as well as I did that it was not. "Shoot, or he'll be off," whispered he impatiently, as the animal was drawing nearer and nearer—when lo! a stag, looking as dark as a "peat-hag," and carrying a huge pile of antlers, emerges slowly and hesitatingly from the wood. How my heart thumps against my ribs as the much-coveted black stag—for I have now not a doubt about its being the identical animal—stands before us within a hundred yards! There is no time to wait for my sudden excitement to abate, as the small beast has fed up very close to us, and the light evening wind is capricious. With trembling hands I slowly lift the rifle over the brackens, but it wobbles so much, as I try to cover the big fellow's shoulder, that I have to lower it. Again it is raised, and, holding my breath, I press the trigger. Off dashes the small beast down the hill; but the big one, although hard hit, merely gives a start, trots forward a few steps, and again stops, his grand horns thrown proudly back, as he quickly jerks his uplifted head round from side to side, as if at a loss as to what course he should pursue.

"Ne lugga!" (missed him), whispers Ramzan, testily followed by a rapid succession of his exasperating interjections of disappointment. But he is wrong again. Before the stag has time to make up his mind, another bullet—of good solid lead this time—smashes his shoulder. Still, strange to say, he scarcely moves. Gradually, however, his startled demeanour becomes more listless, and his proud head begins slowly to droop. But he is too far out to make sure of finishing him with a shot from the smooth-bore, which would most probably only send him back into the thick forest, where, although so badly wounded, we might as likely as not lose him; so I contrive to reload the rifle, fortunately without his detecting me. Once more it is raised: this time the bullet, passing through him, breaks

the other shoulder, and brings him down on his chest. As we stand up and move towards him, the terrified brute, in his endeavours to escape, actually shoves himself along with his hind-legs down the steep grassy declivity before him. At the bottom of this we find him lying, panting and glaring wildly at us, as if quite prepared to make use of his ponderous horns, which he tosses in such a menacing manner as to make the orthodox rites rather difficult to perform.

Although not so fine a stag as the lost beauty, inasmuch as he had only ten points, yet the dimensions of his grand massive horns are, I think, worth recording. Length, nearly 42 inches; girth at the thinnest part of the beam, between the bez (or bay) antler and median tine, $7\frac{1}{4}$ inches; girth round the burr, $10\frac{1}{2}$ inches; round the bez antler, three or four inches from the beam, $5\frac{1}{2}$ inches, and brow antlers nearly as thick; span inside the beams, 33 inches. All the points were perfect.

From this place we returned to Nouboog. On reaching it we found that the dried-up grass on the heights about it had just been set fire to, which ruined all chance of further sport there. I had my suspicions as to who had raised this conflagration. At night the effect produced by the burning was truly grand, as the fire crept slowly on in long irregular lines, some of them many hundred yards in length. Here it shot up high in quivering tongues of flame as it ignited some dead old resinous pine-trunk and licked along its withered branches, casting a lurid glow on the murky clouds of smoke that hovered above. There, like streams of molten lava, it crept down the mountain-side, or flickered and smouldered in isolated spots on the dark devastated expanse where the raging element had already spent its fury and passed on. One would suppose that such fires ought to utterly destroy every tree in a forest; but here, strange to say, comparatively little damage is done to the timber.

In Indian forests, after the trees have attained a certain

size, they seem, as a rule, to become almost fireproof; for notwithstanding the annual burning of dry grass and brushwood on the mountain-sides, you seldom or never see those tracts of charred and withered timber-skeletons so constantly met with in the American backwoods. I therefore very much doubt whether burning the undergrowth is here so prejudicial as is generally supposed. In the forests of "sal" and other hardwood trees of the Terai and Dehra Doon, the ravages of white ants, especially where the undergrowth is left unburnt, are, I am sure, more injurious to well-grown trees than is the slight scorching of their outer bark by fire. Moreover, the fire to a great extent arrests the progress of destruction by the ants, and the clearance of useless scrub-jungle by burning gives freedom for the better development of the more matured timber. The exclusion of the natives, too, from the forests, in which, since the time when nature first planted the trees there, they have had the privilege of grazing their herds, has caused an amount of discontent, not to say distress, with which the doubtful advantage of such a proceeding is hardly commensurate. To this may be added the increase of malaria caused by the rank vegetation being left to rot on the ground from year to year. By all means protect the saplings up to a certain age; but would it not be better, after the timber has reached a fair size, that the villagers should be permitted to burn the undergrowth in order to provide fresh young fodder for grazing their herds on as heretofore? The manure from the ashes and cattle ordure, and the clearance of the undergrowth, would tend to improve the trees, which would then be tall and strong enough to resist the ravages of the fire, though not those of the white ants, which would be decreased by it. In order to justify my idea, let me remark that I can remember the time when, notwithstanding the annual conflagrations and the grazing of cattle in the forests, the hardwood timber of Dehra Doon was of as fine a size and quality as it is ever likely to be again with any amount of conserving. I know

of one instance in Scotland where a tree was actually improved by being scorched. It was an apple-tree, raised from Canadian seed, in a clergyman's garden in Forfarshire. For years after it had attained a considerable size, it never showed a sign of bearing fruit, until a pile of dry weeds and garden refuse lying below it having been casually set fire to, scorched it so much that the owner thought it was dead. The following year, to his surprise, it again burst into leaf, and for the first time yielded a heavy crop of splendid fruit. However, the foregoing remarks are intended more as suggestions than dogmatic assertions, for time alone can prove their validity or their futility.

As the stags had now almost ceased their bellowing in the forests, and were consequently very difficult to find, I took to driving some of the densely wooded gorges for bears and musk-deer; and driving is, in my humble opinion, not to be compared with what our American cousins call "still-hunting" in close country, or to stalking your game on more open ground. The Cashmerees generally drive a gorge upwards, the ridges on each side being guarded by men posted as stops at short intervals along them, whilst at first, only a few beaters advance slowly and quietly from below, giving an occasional tap with their sticks against a tree. The line is augmented by the flankers as it reaches their respective posts, until all hands arrive at the head of the gorge, along which the guns are posted under suitable cover. During the few times this plan was tried, a good many hinds and calves were driven out, but only one good stag was seen, and that broke back through the beaters. Several black bears and musk-deer were also beaten out: one of the former I shot. As I was unable to secure another horned beast to furnish a new ear for the mutilated head, I was reluctantly forced to sacrifice a good hind for this purpose, as well as to provide venison for our camp larder.

By this time I was getting near the end of the tether of my leave, and was in daily expectation of the Cashmere

Government authorities sending me notice to quit. Indeed, I wondered they had not done so already, for all visitors were in those days expected to be out of Cashmere by the 15th of October, and it was now November. Had I not taken the precaution to keep on good terms with the headmen of the villages by making small pecuniary gifts and sending them haunches of venison, they doubtless would, long ere this, have taken steps to rid themselves of my presence among them, by informing against me. Instead of this I had no difficulty in collecting as many willing beaters as I required. Moreover, they were always marshalled by a great hulking fellow who, on my first arrival at Noubog, with my full approbation when I had duly inquired into the case, administered condign punishment to one of my Hindustani servants for having abused him.

Such as I have attempted to describe was hangul-shooting at that time in Cashmere. Since then, I am told, the late Maharajah Runbeer Sing took to profusely decorating his palatial halls with stags' horns. The traffic in them, too, has of late years become much more extensive. And formerly, when the slaughter of a bovine animal was considered a capital offence in Cashmere, hangul skins were used for making the accoutrements of the soldiers, and this may be the case even now. At all events, the deer have decreased in numbers, and the sportsman may have to go farther afield to find them.

CHAPTER XVII.

THE following endeavour to recount some hunting experiences in Tibet will by no means represent what may be termed a competition-bag of game, which, in these days of competition in everything, seems, sad to say, often to be thought almost the main object in shooting. Nevertheless, I trust it may afford the reader some idea of what the writer considered real wild sport in a very strange land.

Once more I would invite the reader to accompany me to that "valley of bliss"—Cashmere. This time, however, we shall merely pass through its quaint old capital, and at once proceed up the beautiful Sind valley, with its coppices of hazel and hawthorn, its tangled thickets of honeysuckle and wild rose, and its picturesque log-built hamlets nestling snugly at the foot of the mountains amidst groves of walnut, apple, and mulberry trees, and grand old chenars. Much as we may wish to linger in such a romantic locality, we must not do so this time, for it is past the middle of May, and we are bound direct for a very different style of country—the remote, desolate wilds of Changchenmo—and a long tramp is before us ere we reach those haunts of the dong (wild yak) and the tsos (Tibetan antelope).

Twenty days from Cashmere took us to the town of Leh, the capital of Ladak. Its most prominent features are a fortified palace, so called, from the top of which we get a good view of the place and its environs; and a rather imposing bazaar, where furs, precious stones, and other com-

TIBETAN GAME.

mercial products of Eastern Turkestan freely change hands. In its immediate vicinity are a few poplar-groves and fruit-orchards, their vivid green contrasting rather strangely with the surrounding sterile plateau, which extends for miles towards the equally arid mountains that enclose it. Regarding this town, little more need be said here than that there, at an elevation of nearly 12,000 feet, the sun burns with an intensity that is truly surprising, the thermometer in summer often reaching 140 degrees or more in its rays; whilst the temperature in the shade is quite cold, and at night often freezing. The patient reader who may have accompanied me so far in my wanderings, had now better go no farther unless he is prepared to traverse some pretty high and rough country ere he reaches Changchenmo, which has little to recommend it beyond its being a favourite haunt of the wild yak and other Tibetan game.

Thus far I had had the pleasure of travelling from Cashmere with an old friend and schoolmate—Captain Basevi, R.E.—who was proceeding to carry out certain scientific observations on the highly elevated table-lands, which are among the principal geographical features of this part of Tibet, and were peculiarly suitable for his purpose. But from Leh our routes and avocations unfortunately lay in different directions.

Here I met a brother sportsman, Major M., who was bound for Changchenmo; and as it is as pleasant as advisable to have a companion in remote uninhabited regions, we joined camps. We were rather disappointed, however, on hearing that two other members of the fraternity had already preceded us there; for in Changchenmo the wild yaks usually frequent certain localities, from which they are soon scared away if disturbed.

At Leh we engaged the services of an individual named Kurreem, a half-bred Tartar, who had, I believed, been converted to the Mohammedan persuasion. He willingly agreed to act as interpreter in the language of the country and make

himself generally useful, on a salary of four rupees a-month and his food.

After two days' rest we made a fresh start. For two marches our route lay along the right (north) bank of the Indus. We passed several of those curious oblong-shaped cairns which are so often seen by the wayside in Tibet, called *mānes*. They are formed of small slabs of rough stone piled loosely one upon the other, and vary in length from a few yards to sometimes several hundred. Each flat stone has inscribed on it the words, "Om mani padmi hom"—meaning, O God! the jewel in the lotus. We passed one of these erections, which was some five or six hundred paces long, and every stone of it had, I was told, this short prayer engraved on it. All Tibetan Buddhists constantly repeat these words when twirling their little hand prayer-cylinders, which contain a scroll inscribed with the same mystical sentence, and each revolution is supposed to represent a repetition of it. The Tibetans always pass these *mānes*, or roadside shrines, on the right, whichever direction they may be travelling,—thereby, I suppose, ensuring their going round them should they return by the same route; circumambulation, as well as rotatory motion, being among the ritual forms of the Tibetan Buddhist religion.

Across the Indus, opposite to where our path quitted its valley at Khurroo, is the great Buddhist monastery of Hemis, hidden away in a sequestered gorge. It is said to contain several hundred Lamas. We now turned northwards up a narrow glen leading to the Chang la (pass), and encamped at Chimray, where there is another fine monastery perched high on a hill.

The pass, although over 18,000 feet high, is easy to cross, but we suffered somewhat from the rarefied air. Besides the usual shortness of breath and the feeling of extra weight and lassitude, more especially about the legs, in me it produced headache and nausea, which I did not get rid of until the following day, when we descended to Tanksee.

The south side of the pass was quite devoid of snow; the gently sloping north side, however, was considerably patched with it, and the cold at night was intense. And here I may remark, that although the perpetual-snow line on the western side of the main Himalayan chain is somewhere about 16,000 feet, eastward on the ranges rising from the Tibetan uplands it is nearly, if not quite, 20,000 feet. This difference may possibly be owing to the extreme dryness of the atmosphere on the Tibetan side.

Tanksee, a considerable-sized village, being the last place on our route where men, yaks (the domestic bovine cattle of Tibet) for carrying our baggage, and food were procurable, we made arrangements accordingly. Here I secured the services of a Tartar named Changter as guide, a pastoral inhabitant of the Pangong district, who was well acquainted with the haunts of the game there and in Changchenmo, and who had the advantage of possessing a very slight knowledge of the Hindustani language. He was accompanied by his son, a little lad named Norgie, who attached himself to my companion, the Major, in the capacity of gillie—and an uncommonly sharp one he made, notwithstanding his youth. Here I hired a pony—the Major was too proud to ride—by way of saving myself as much unnecessary toil as possible; and a few small sheep were purchased for our commissariat department, at one rupee (eighteenpence) per head.

The first evening after leaving Tanksee, by way of amusement as well as of making ourselves acquainted with our Tartar followers, we gathered them together around the camp-fire of sun-dried yak's dung—the only fuel procurable—collected in the vicinity, and got them to sing, dance, and perform on a musical instrument like a long, wooden penny whistle, from which they contrived to produce wonderfully dulcet tones. Great was their delight on the Major's passing round a snuff-box, and loud and boisterous their mirth at seeing one another sneeze.

On the second morning we reached the western end of the Pangong tso (lake), when, on emerging from a long glen flanked on the one side by steep stony slopes, on the other by beetling cliffs of a yellowish hue,¹ such a wonderful prospect suddenly presented itself as to amply repay any one for the long toilsome journey which has to be undergone to behold it.

Beneath a cloudless sky, the deep sapphire blue of which was rendered extraordinarily intense in the rippling waves that reflected it, lay this salt-water lake, at an elevation of 14,000 feet, stretching away for about thirty miles of its visible length, its width being about five or six. From its shores of pale-yellow sand, on either side rose barren heights—some of them streaked and capped with perpetual snow—whose brilliant yet harmoniously blended colouring of every tint except green baffles all description. Here and there a pure white glacier lay between the ridges that stretched down towards the water, and sometimes jutted into it in fantastic-shaped promontories and bluffs, their successive receding outlines growing more faint, until hardly distinguishable against the purplish-blue of the snow-crested mountains that bounded our view of the lake, where it takes a leftward turn for some twelve more miles.

The strangely wild beauty of this scene was enhanced by the extreme clearness of the air, which in Tibet renders surrounding objects, and their black clear-cut shadows, almost startlingly distinct, and distances most deceptive. A natural consequence of so transparent an atmosphere is, that the sun's rays strike through it with the most astonishing power. Indeed, from the moment the sun appears over the horizon it commences pitching into your face, and especially your poor nose; and even although these may be shaded from

¹ These tall cliffs were entirely formed of a rather friable kind of alabaster or gypsum, as we found from the snow-white blocks of it, recently detached from above, that had rolled down below, the yellow colour on the surface being caused by the action of the weather.

its direct beams, the radiation from the dry stony ground is so great as to make some sort of covering for the face very desirable. And oh! the merciless, marrow-searching wind that hardly ever ceases blowing on these bare Tibetan steppes, except for a few hours in the morning, and not always even then. How it, combined with hard frost every night, parches and cracks the sun-scorched skin on your face and lips, until speaking becomes painful, to laugh is a torture, and to wash is almost impossible. Day after day the skin peels off your face and hands. There is no escape from this evil in Tibet; it is *the* great drawback to a trip there. I generally wore a kind of mask made of thin cloth, extending down just over the nose, with apertures for the eyes, and always kept my face well smeared with a salve composed of bear's grease and spermaceti, which acted like basting to roast-meat, inasmuch as it prevented the skin from being quite frizzled up. Yet, with all its inconveniences, the light dry air of Tibet is singularly exhilarating, and notwithstanding the sudden and extreme variations of temperature, highly salubrious. But at this rate we shall be a long time reaching Changchenmo.

We camped at Lookoong, two miles north of the lake—a hamlet consisting of a few wretched little hovels, with about half an acre of irrigated cultivation attached. This was the last sign of any human habitation we should meet with until our return from the inhospitable region we were about to visit. From here two days more took us over the Marsemik la into Changchenmo. The ascent to this pass is so very gradual and easy, and there was so little snow lying even on its gentle northern slope when we crossed, that it was difficult to believe we were 18,600 feet above the sea-level; but almost all of us, our Tartars included, suffered more or less from headache, and my nose bled slightly.

The best remedy for the unpleasant effects caused by rarefied air I found to be cold strong tea; spirits only

increased them. The Tartars, however, drink quantities of *chung*, the weak spirit of the country, distilled from a kind of barley called *grim*, which, they say, answers the same purpose. It has a sweetish and not altogether unpleasant taste. In the more northern Himalayas, eating raw onions is said by the natives to mitigate these disagreeable sensations. And here I may offer a bit of advice: never cross a high pass on an empty stomach.

We camped beside the Changchenmo river—a tributary of the Shyok—which flows over its wide shingly bed between bare, brown, stony slopes, surmounted with precipitous heights of the reddish and ochreous hues often so conspicuous in the colouring of the mountains in this strange land. Hereabout, growing on the sand-hills beside the river, we were surprised and delighted to find plenty of fuel in the shape of a kind of tamarisk called *oomboo*, which was so dry and inflammable that we had only to put a match to a big bush for the strong wind to at once set it ablaze and keep it smouldering away for hours, always taking care it was to leeward of our tents.

We now learnt from two Tartars left in charge of supplies belonging to the sportsmen ahead of us, that their masters were, as we expected, in possession of the best hunting localities. After a conference with Changter, he suggested that we should proceed up another long glen north of Changchenmo, named Kugrang, which he said was usually a pretty sure find for wild yaks. The Tartars had informed us that one of the sportsmen was hunting somewhere about the head of this glen; but as Changter said it was more than twenty miles in length, and that there were one or two long lateral branches leading out of it, we considered that our each occupying one of these would not be poaching. The Major accordingly decided on taking up his quarters in one of them, whilst I did the same in another.

In order to reach our ground, it was necessary to cross

the Changchenmo river. Forging this treacherous stream is always more or less unpleasant, and sometimes dangerous; for during the summer it can only be crossed at certain places, and at these only during the space of a few hours in the morning, after which a dirty turbulent flood of melted snow suddenly comes rushing down, and spreading itself over the wide bed of shifting sand and gravel, renders it quite impassable.

As we pursued our way up the Kugrang glen we saw several small troops of kiang (*Equus hemionus*), the wild horse of Tibet, whose shy behaviour showed us that human intentions had not always been so harmless towards them as ours were. The kiang can hardly be called handsome, on account of its rather ungainly head, hog mane, and almost rat tail, which it always tucks in when it gallops; but it shows many good points. It stands about Galloway height, and its general colour on the body and head is a reddish dun, with a dark dorsal stripe. Its belly and legs are a creamy-white, as also is its nose. It is considered by some to be a wild ass. Its ears, however, are not large like those of a donkey, nor does it bray like one, its whinny being quite that of a horse.

We saw also two buck antelopes, which I attempted to stalk, but failed to get nearer than 200 yards before they decamped. Scanty as vegetation was everywhere, we found more of it here, strange to say, though at a considerably higher elevation, than in the main valley of Changchenmo, which accounted for game being more plentiful in this locality.

The Major now went on with his men to establish his hunting-quarters in an offshoot to the left, whilst I, accompanied by Changter, Kurreem, and a man leading my pony, turned up one northward to the right, our baggage-yaks following leisurely behind us. This offshoot of the Kugrang, Changter called Chang Loong Koongma. It runs up parallel to, and eight or ten miles west of, Chang Loong Yokma,

leading to the desert plain of Lingzitang, averaging over 17,000 feet, across which vast elevated waste lies the route to Yarkand. We had proceeded two or three miles when Changter detected some moving objects on a gently sloping plateau far away up the glen. The glass was soon brought to bear on them, when they proved to be a herd of seven antelopes, and two kiangs that were grazing near them. After watching for some time, we were glad to see the horses move off, leaving us a better chance of a stalk at the antelopes, amongst which I could discover several good bucks. As there was little chance of their noticing us at so great a distance, we moved cautiously on until we gained the cover of a high sloping bank, rising beside the stream that flowed down the glen. Here we left the pony, giving instructions to the man in charge of him to have the tents pitched, on their arrival, in a sheltered nook, whilst Changter, Kurreem, and I went on to try and circumvent the antelopes.

We had proceeded some distance along the stony bed of the stream, under cover of the steep sloping bank beside it, when we were suddenly brought to a stand-still by seeing a buck antelope moving in front of us down towards the stream, and a second soon followed. They were still a considerable way off, and, fortunately, did not detect us before we had crouched as close as possible under cover of the bank. Waiting until they were hidden behind some rising ground, we again moved cautiously forward. At length we reached the spot where they had disappeared, but, to our dismay, they were nowhere visible beyond it. Thinking they might have gone back again on to the higher ground, we crept up the steep bank and peered over it, when a single doe, that happened to be close by on the plateau above, catching sight of us, went away at speed. Still there was no sign of the bucks; and as the wind, which had hitherto favoured us, had now veered round, we made sure that they too had got intelligence of us and

departed. As we lay there, uncertain as to what our next move should be, I noticed that old Changter's countenance brightened up, and his wandering eyes suddenly became fixed. Turning his head slowly towards me, he drew my attention to some animals near the mouth of a small gorge some 400 yards off, and whispered “Nian” (*Ovis Ammon*).

For the moment the antelopes were forgotten as the spy-glass was directed on the nobler animals, but those in sight turned out to be ewes; and as Changter assured me that at this season there was little chance of finding old rams and ewes in the same flock, my disappointment was considerable, though I would fain have believed him to be wrong in this instance. He was right, however, as was proved when the beasts got our wind, and the herd, which consisted only of three ewes, sped away up the gorge and disappeared.

As the sun was still pretty high, we decided upon moving a little farther up the glen on the chance of again finding the antelopes. We were descending the sloping bank with the intention of getting back into the stream-bed, when we heard a clatter amongst the loose stones. To our astonishment we beheld a fine buck antelope coming galloping towards us along the slope, and apparently so bewildered by something that had scared him that he failed to observe us until he got within fifty yards, when, suddenly detecting us, he wheeled sharp round. I had only time to snatch my rifle from Changter and take a snap-shot, before the animal disappeared over the brow of the rise above us. Although he showed no signs of being hurt, I thought from the sound that the bullet had struck him. Quite forgetting the great height we were at—well over 17,000 feet—I ran back quickly up the slope, and on reaching the top saw the buck standing within twenty yards, his drooping head showing how sorely he was wounded; but I was quite incapable of using my rifle. There I was obliged to lie down, gasping for breath, with my heart beating as if it were ready to burst, whilst the buck moved slowly off, gradually increasing

his pace until he was lost to view in a neighbouring ravine. My two men, who had wisely taken it more quietly, reached the top of the brae just in time to see the buck before he disappeared, much to their disappointment, which I think was equalled by their astonishment at finding me lying panting on the ground without making any attempt to stop him.

It was some time before I recovered breath enough to follow the buck, which both the men said I had missed; but as I was now quite sure he was hit, and badly too, I proceeded towards the ravine at a much more moderate pace. As we neared it, I lay down, and gradually worming myself along for some distance over the sharp loose stones, slowly raised my head. There, as I had half expected, lay the buck about a hundred yards off in the ravine. Before I could get my elbows well planted on the ground and the rifle levelled, he was up and making off again, when, to the great delight of old Changter, who had crawled up beside me, the report of the rifle was followed by the buck throwing back his horns, tottering forward a few yards, and falling struggling on his side.

Whilst the men were skinning and cutting him up, there was ample time to note his general appearance; and as he was a good average specimen of a buck tsos, a short description of the Tibetan antelope (*Kemas Hodgsonii*) may perhaps interest those who have never seen this animal. He measures from thirty-two inches to thirty-four inches at the shoulder; thick and soft, almost woolly pile, of a very pale-yellowish grey on the body, merging into white below the chest, inside the legs, and on the stern; dark-brown marks down the front of the legs, on the fore ones extending up to the shoulder; an almost black patch on the face from between the eyes downwards; muzzle very thick and coarse, with an odd kind of puffy protuberance beside each nostril—possibly a provision of nature for assisting respiration at the very high altitude this animal affects; another curious glandular

protuberance in each groin; tail about four inches long and tipped with white; horns black and lyrate, two feet long, set very erect and far forward on the forehead, and about a foot apart at the tips, slightly curved forward, closely knotted in front for two-thirds of their length from the base, and smooth behind. The does, or what I took to be does, for I never shot at them, appeared to be very similar in colour to the bucks, but hornless, and without the black patch on the face. A unicorn animal is said to be found farther northward on these desert steppes, but I believe its existence to be as fabulous as that of the equine creature represented to the youthful imagination as fighting with the lion for the crown. An antelope minus one of its horns may possibly have given rise to the idea. It is also said that the camel is found in a wild state farther north, within the territory of Khoten. These antelopes usually frequent localities where the ground is more or less level or undulating, and are never found much below 15,000 feet, though they often ascend the sloping faces of the mountains to much greater heights, and particularly after being scared. Like all Tibetan game, their powers of sight and scent are extremely acute. Their flesh is tender and juicy.

During the first night or two up here, and especially towards morning, I experienced the uncomfortable sensation of being unable to sufficiently inflate the lungs, which may be described as a constant inclination to heave a deep-drawn sigh. This was not to be surprised at, considering our camp was at an elevation of 17,000 feet, calculated with a boiling-point thermometer I had brought with me. It gradually wore off, however, as I became more accustomed to passing the night in such intensely cold and rarefied air.

Whilst in this high valley, I, strange to say, never suffered in the slightest degree from the pausea and headache I experienced on the open and tolerably level summits of the Chang la and Marsemik, even when at as great altitudes. Here I felt nothing more than shortness of breath when

ascending ever so gentle a rise, and a weight about the legs, as if gravity were exercising an undue amount of influence on them. On the upper ranges of the Himalayas, the natives attribute the more unpleasant sensations to the exhalations from certain poisonous plants¹ growing at great heights permeating the air; and my shikarees, when telling me about shooting localities close under the snowy range, would describe some of them as being bad for *bhik* (poison), whilst others which were as high, or higher, they said, were free from it. Although this idea is generally ridiculed by Europeans, it is so universally entertained throughout the Himalayas by the hill-men, as to make one almost think there must be some foundation for it. I certainly have seen the deadly aconite flourishing luxuriantly on the higher ranges, where the tall spike-like heads of its intense blue blossom have a very striking and beautiful effect, shooting up, as they often do, from some moist green spot, thickly besprinkled with buttercups, amidst grey rocks and snow-beds.

At great heights I have always felt the effects of rarefied air more on table-lands, or where the surroundings were comparatively level or undulating, than at similar elevations where they were very steep, either upward or downward—and I believe my experience in this respect is not singular. Moreover, it is remarkable that at Leh, which is under 12,000 feet, but situated on an extensive open plateau, even the Tartars themselves are said to complain of shortness in breathing and headache. From this it would seem either that height is not the sole cause of, at any rate, the latter sensation, or the rarity of the air must vary considerably at equal altitudes, under different conditions. These ideas, which have been suggested to me not only by my own experiences, but also by those of other Himalayan travellers with whom I have talked on the subject, may perhaps be considered rather wild, so let us now turn

¹ A Californian shrub, commonly called "poison-oak," is said by the natives to have a noxious effect on those who inhale the air in its close vicinity.

from this long theoretical digression to something more practical.

Next morning we went up the glen in search of dung. There was a desolate grandeur about the mountains flanking it that was very striking, though perhaps not so charming to the eye as the forest-clad ranges of the Himalayas. The high arid hills to the right were rounded in form and of a general reddish yellow, like the colour of a half-burnt brick; whereas on the left they reared aloft in grey precipices, or in steep acclivities covered with large loose stones and shingle towards broad beds of snow, or serrated ridges of rock frowning grimly above. In some of the rifts and gullies running down into the glen lay beds of *névé*, terminating in abrupt broken declivities of pure white ice. Altogether it was a savage scene of utter loneliness, which language would fail to describe. And the silence!—during the lulls between the howling blasts of wind, the deep depressing silence that reigned over this desert waste was truly appalling. In most places one is accustomed to the buzz of insects, the rustle of leaves, or the “busy hum,” though perhaps only as an almost imperceptible murmur. Even at dead of night the air is nearly always stirred by sound of some kind, however lightly it may affect the sense of hearing. Here, the stillness is as of a sepulchre—all Nature seems dead!

But I am forgetting that as so comparatively few of my readers can have seen the wild yak of Tibet (*Pephaqus grunniens*), the majority of them may wish to know what the creature is like. Imagine, then, a clumsy bovine animal,¹ standing from 16 to 18 hands at the shoulder,

¹ Dimensions of a wild bull yak shot by Colonel E. Smyth: circumference of horn at base, 18 inches; length of ditto, 36 inches. Space between the eyes, 16 inches; between the horns to tip of nose, 29½ inches; between horns to root of tail, 8 feet 5 inches; length of tail, 37 inches. Height, 18 hands, or 6 feet (as far as it was possible to take it of a dead animal). Circumference of fore-foot, 21¾ inches; ditto hind-foot, 19 inches. Girth round belly, 9 feet 8 inches; ditto round shoulder, 10 feet 1 inch; ditto round neck at thinnest

which is considerably higher than the croup, with a rough coat of a general rusty black inclining to greyish on the withers; a large, stooping head, slightly grey on the face and about the muzzle, and set on a rather lean neck;

Yak.

curly grizzled hair all over the forehead, almost concealing the eyes; thick round horns from 2 to 3 feet long, and about 18 inches in girth, growing outwards, curving to the front, and turning upwards near their points; an enormous bushy black tail, extending below the hocks; a thick fringe of long, matted, black hair hanging from the shoulders, sides, and flanks, and reaching about half-way down the short sturdy limbs,—and you have some sort of idea of a bull dong as he is here called. The cows have much the same general appearance, but are considerably smaller and less shaggy, and carry thinner and shorter horns than the bulls. Wild yaks generally congregate in herds, which may contain any number up to considerably over a hundred, but they are sometimes found singly. Their habitat is never lower than 14,000 feet.

part, 4 feet 2 inches. This animal (or else one shot at the same time, a little smaller) is now in the Leeds museum, very well stuffed and set up.

Towards the head of the glen there were marks of these wild beeves that had been there some time before, but they had evidently shifted their ground. Doe antelopes—or what I supposed were does, for they all appeared hornless—were pretty numerous; but not a good buck did we see until we reached the almost level snowless summit of a very high pass—though it did not appear so from the great height we were already at—which terminated the glen. Here a fine fellow suddenly showed himself, and offered such a tempting shot that I could not resist the temptation to let drive at him, even at the risk of disturbing any dong that might have been in the vicinity. Of doing this there was, however, little fear, as the wind sweeping over the pass was quite enough to prevent a shot being heard at any distance.

The buck moved on slowly a short way, and then lay down. Giving him a wide berth for the present, with the intention of looking him up on our way back, when we should have a better chance of securing him, we went a considerable distance down the other side of the range, to a prominent spot which commanded an extensive view of the savage mountainous wilderness beyond. Even Changter, who had been exploring this wild country since his youth, said he knew little about the remote region across this pass. Every visible atom of ground which was only here and there patched with snow was carefully scrutinised through the spy-glass. Still there were no dong to be seen—only a couple of wild horses quietly grazing on an isolated green spot beside a little stream, more than a mile off and far below us; and a fine fox with a light sandy-coloured coat and a white-tipped brush. He jumped up quite close to us, and turning round within an easy stone's-throw, stood gazing at us for some time as if with much wonder at our presence in this high solitude.

It was now late in the afternoon, and we were at least eight miles from our camp, so we returned to try and pick

up the wounded buck. As I did not wish again to risk disturbing the ground by shooting at him unless absolutely necessary, he gave us a long chase before we caught him; fortunately he kept pretty straight down the glen.

I had not made a halt since leaving Leh; so, by way of taking a much-needed rest, the next day was devoted to dressing the antelope heads and working up some little sketches I had made.

On the following morning we started early to again try our luck after the wild yaks. This time I took the pony, to ride wherever the ground permitted; and I would advise any one who hunts in Tibet not to be too proud to do likewise, for the work that must necessarily be done on foot, when actually following game, will be found quite severe enough up here, where your legs always feel as if weighted with lead, without any extra and unnecessary toil when it can be avoided. In the inhabited districts of this part of Tibet a pony can generally be hired, which, as it seldom wants any food but what it can pick up for itself, will be much better suited for the work required of it than an animal brought with one; or a tame yak can be ridden with much comfort, and its paces are smooth and easy. But to proceed.

We had not gone far when five buck tsos were descried far away up on a sloping hillside; but I had determined to devote this day entirely to searching for dong, so we did not attempt a stalk.

Feeling much disappointed at again not finding any dong in the glen, I sat myself down about a mile below the pass, whilst I sent on a Tartar to prospect the country beyond it. Nearly two hours went by without the re-appearance of our scout. I had eaten my luncheon and emptied my bottle of cold tea. The sun was far too powerful to allow of my taking a nap to pass the time, and there was hardly a square inch of shade anywhere near to protect us from its almost vertical rays. Another hour passed, and

my patience was getting exhausted, when Changter and Kurreem, who had been for some time lying dozing near me, suddenly lifted their heads, and said they thought they heard a shout in the direction of the pass. Hark to it again! There is no doubt about it now, as this time it is borne faintly towards us on the wind that comes sweeping down from the pass in true Tibetan style; and with the telescope I can distinctly see the Tartar signalling to us to come up. As the ascent is very gentle and easy, we are not long in reaching him, when, to our great delight, he reports having seen a single dong on the little green oasis where we had noticed the kiangs grazing two days before.

Half running down the gradual and snowless slope on the other side of the pass, we soon reach our old look-out spot, from whence we can see our quarry, looking like a little black dot in the distance away below us; but we shall have to try all we know to circumvent the beast, for the ground is most unfavourable for a stalk. Our only chance rests in being able to reach the bottom of a deep wide valley between us and the dong, by scrambling down a steep stony gully which is in full view of the animal. If we can only manage to get down this unobserved and the wind favours us, the rest of the stalk appears to be comparatively easy.

Slipping the covers on the rifles to prevent the sun glinting on the barrels, and trusting to the great distance keeping our movements unnoticed, Changter and I commence the descent, leaving Kurreem to stop the man leading the pony, who has lagged some way behind us. Fortune is so far kind that we reach the bottom of the valley unperceived; but a serious obstacle here presents itself in the shape of a rapid swollen torrent of dirty melted snow. Up this we find we must make our way until we can discover a fordable place. Carefully watching the dong's movements, with our bodies bent nearly double, we move forward a few paces whilst it feeds with its head from us, crouching down

motionless as the stones beside us whenever the animal turns towards us. Thus we slowly proceed for several hundred paces, until we gain the cover of a high bank on the far side of the stream. To my great relief, we can now walk upright until we reach a fordable-looking place some distance farther on. After wading pretty deep through the ice-cold, rapid-running water, we have to double back down beside it until we arrive at the foot of a narrow ravine, some distance up and to the left of which lies the little green flat on which we hope to find the dong. As we slowly proceed up the ravine, treading carefully to avoid rattling the stones, old Changter in a whisper cautions me to take time, and not to fire until I can get a shot at the animal's right side, which, he says, is more deadly than the left in a dong. He little knows the penetrating power of a hardened Whitworth bullet.

At last we reach a point which we judge to be about level with the animal. Here we stop to recover our breath, which has been pretty well pumped out of us by our recent exertions. Stealthily we crawl up the sloping side of the ravine, over the most abominably sharp stones, and on cautiously peering over the top, discover the yak within a hundred yards, now lying with its head turned from us. A slight rattle made among the loose stones whilst trying to plant my elbows steadily for the shot, at once attracts the beast's attention. Springing to its feet with the most wonderful alacrity for such a big brute, it stands broadside on, with its head turned towards us. Before it has time to think of making off, the sharp report of the Whitworth rifle rings out, and I can see the dust knocked up by the bullet ricochetting on the gravelly slope rising beyond the animal. Away the beast goes up the slope at a gallop. I must by some mischance have shot over it. The contents of the other barrel are sent after it, but it still holds on. This time I feel certain I have missed, and my heart sinks within me. But there is yet a chance, for the beast breaks into a trot, and

then into a walk, which becomes slower and slower, until at last it pulls up and turns its drooping head to look back. Taking the other rifle from Changter's ready hands, and quickly adjusting the sight for 200 yards, which in such rarefied air does for a much greater distance, I fire again. "Shabash!" (bravo), exclaims the old fellow, jumping up excitedly, as the dong totters for a few seconds, and then falling heavily on its side, lies kicking in its death-struggle.

On examining the carcass, we found that the first bullet had passed clean through behind the shoulder, and had afterwards knocked up the dust on the slope. The second had missed entirely, and the last had struck within a few inches of the first, but, taking a more forward direction, had actually perforated the heart, as was found on taking it out—a lucky shot!

It was rather disappointing to find that the animal was a female, for the head's sake; but I tried to console myself with the idea that cow-beef was preferable to bull-beef, and was certainly better than none at all,—and her fine bushy tail was, at any rate, a trophy worth having.

As the sun was now getting low, we could do little more that day than gralloch the dead beast. Whilst performing this operation, another dong suddenly emerged from a gorge below us; but catching our wind at once, it went off at a rattling pace, and was soon lost to view. It was dusk by the time we had recrossed the pass. Fortunately there was a splendid bright moon to light us down the glen, as the rapid stream flowing through it had to be crossed and recrossed several times at certain places, and fording it in the dark might have been a difficult, if not a dangerous undertaking. There is little risk, however, of getting belated in Tibet if the sky is cloudless, as the starlight alone, at such a high altitude, is broad enough to admit of surrounding objects being seen with unusual distinctness, and cloudy nights are exceptional. We were so late in getting back that our Tartars

left in camp, fearing some mishap had befallen us, had started in search of us.

After sending off a couple of the baggage-yaks early next morning to carry in the beef, I went after the five bucks we had seen the day before on our way up the glen. We found them still on the same ground, but they were now on the alert, having winded us on our way up the hill; so our attempt to stalk them was fruitless. Later on in the day, we descried in the distance several black objects which we at first took to be dong; but, much to our disappointment, the glass showed them to be some of our baggage-yaks that had wandered miles away, on their own hook, in search of food.

Great was the rejoicing in camp that evening when the yaks returned laden with the meat; and a juicy beef-steak was a most acceptable addition to my own dinner—for, with the exception of there being little fat on it, the flesh of the dong is much the same as any other beef.

As Changter seemed to think there was now small hope of our finding dong in this glen, which, although usually considered one of their favourite haunts, they had this year apparently almost entirely forsaken, and the only other likely places for them in Changchenmo were occupied, and would probably be so for some time, I decided on retracing my steps to the Pangong country, where *Oves Ammon* were said to be more numerous. By staying on here I might have killed many antelopes, and, by dint of excessive hard work, combined with much patience and luck, I might eventually have found a few dong on the ground beyond the pass; but my object was variety, not quantity, of Tibetan game. Moreover, I was particularly anxious to see as much as possible of other parts of this most remarkable land during my short sojourn in it. I therefore thought it waste of my limited time to remain longer in Changchenmo.

I had communicated my intentions by a messenger to the Major, and he agreed still to accompany me; so next day I

rejoined him where he had moved his camp to the foot of the glen I was in. He had killed a fine buck antelope, but unfortunately some wild dogs had been sharing the sport on the same ground with him. It was rather late in the morning when we reformed the Changchenmo river, consequently one of the baggage-yaks had a mishap in the rapid water with its load, and my bedding, my shot-cartridges, and other things it was carrying got thoroughly wet. In the evening we were driven nearly distracted by myriads of almost invisible little sand-flies; and to add to our troubles, a pot of capital soup made of a hare I had shot, which we had been watching the preparation of with hungry eyes, was accidentally upset.

We had heard so much about the intense cold of this high region, that we were rather surprised at having hitherto suffered almost more from the scorching sun, although the wind was always cutting cold, and there was keen frost every night. We were not, however, to quit it without a taste of what the climate sometimes could be, even in the month of July. Next evening, after a long day's march, varied by grilling-hot sunshine and bitter-cold showers of sleet, we camped about six miles short of the top of the Marsemik, intending to cross it in the early morning. Towards dark, clouds began to gather ominously about the mountain-tops, and when we turned in at night snow was falling; but there was no appearance of it lying anywhere in the vicinity, except inside some small covered recesses of a kind of refuge built rudely of loose stones and earth. In these the drift-snow, from being entirely screened from the sun, lay in hard dirt-covered heaps, having probably been deposited there in winter.

In the morning I was awakened by an unusual sound of thumping and pulling at my tent. It turned out to be my servant trying to effect an entrance through the fresh-fallen snow that had drifted up thickly about it, and on looking out, to my astonishment I saw nothing but one white waste

of snow that had fallen nearly a foot deep during the night. The hillsides were shrouded in mist, and snow was still falling,—altogether about as cold and dreary a prospect as one could behold. Our poor yaks presented a most pitiful appearance as they stood helplessly chewing the cud of despondence, being entirely dependent for food—for they will not eat grain—on the small amount of vegetation which was now buried in snow. Even a pair of big ravens that croaked lugubriously about the camp, on the look-out for stray scraps of meat, looked more than usually sad, as they sat there with their sable plumes all ruffled from the cold.

Crossing the pass that day was completely out of the question, both on account of the thick mist and the snow that our men reported to be knee-deep on the track a short distance higher up. Fortunately for us, a quantity of *boortze*¹ had been collected here in readiness for Captain Basevi and his party, who were coming into Changchenmo, or we should have been wellnigh frozen.

The Major had pitched his little tent inside the stone enclosure of the refuge, where, although better protected than mine, it still was half buried in snow. Instead of turning out in the cold as I had done, he had more wisely kept under his blankets, where he snugly snoozed until breakfast-time. By way of trying to keep warm, I went into one of the stone-built recesses, where several of our Tartars were crouching round a small grass-root fire, and was considerably edified by watching them cooking and despatching their morning repast.

To begin with, a very dirty copper vessel was put on the fire and filled with some green weed like nettles, barley-flour, and water. Whilst one of the men stirred this pottage

¹ *Boortze* is a kind of plant not unlike an exaggerated bunch of Alpine *Edelweiss*, with large, thick, dry roots. It grows in tufts, sparsely scattered over the stony ground, and is found almost everywhere where vegetation exists at all in Tibet, and is the principal, and often the only, fuel procurable.

round and round with a wooden ladle, another produced some raw meat—a bit of the dong I had shot. This he proceeded to tear up into small strips and throw them on the fire, every now and then popping a raw lump into his mouth and masticating it with the greatest apparent gusto. Even the bits on the fire were quickly disposed of after being merely singed. As soon as the pottage was considered ready, it was ladled out into little wooden cups, like the whisky “quaighs” of the Highlands, minus the handles, which each man produced from inside the breast of his dirty woollen coat, and gulped up from them with a prodigious amount of noise. After being replenished again and again until the pot was emptied, the cups were carefully licked clean, and redeposited in the place whence they had been taken. Another course of flesh was about to be partaken of, after the manner of the first, but a regard for my own appetite for breakfast prevented my waiting to see it discussed. These hardy Tartars are quite independent of any other dishes beyond their little wooden bowls. In these they mix their “suttoo” (meal made from barley) with a little water and salt, and make an expeditious repast of it whenever they feel hungry. Indeed this kind of uncooked porridge seems to be their staple food.

In the forenoon the sun broke forth, and some idea of its power up here may be formed when I say that by evening the ground about our camp was nearly free from snow, and next morning we were able to proceed without inconvenience over the almost bare earth, which was frozen as hard as iron. This time I felt no uncomfortable sensations from the rarefied air on the pass, nor did I again suffer from them on this trip, even when at considerably higher elevations, beyond the usual feeling of extra weight and lassitude about the legs, and the inclination—indeed I may call it the necessity—for constantly drawing a deep inspiration to fill the lungs, which I have already mentioned.

At Lookoong we stopped for two days to await the arrival of Captain Basevi there, on his way to prosecute his pendulum observations on the highly elevated table-lands in Changchenmo. We took advantage of the halt to have a general wash-up of our dirty clothes in the stream that flowed past the tents, as also did old Changter to improve his personal appearance. For this purpose he came and borrowed one of the butcher-knives I used for skinning animals, to cut his hair with. Being curious to see the result of the process of hair-cutting with a knife, I was selfish enough not to suggest to him the use of a large pair of scissors I possessed. Some hours after, when he again turned up, his head, except where grew his pigtail and a few straggling locks beside it that had escaped the ravages of the knife, resembled the half-shaved back of a hedgehog, as likewise did his son Norgie's, upon which he had also operated.

Our men had caught a lot of excellent little trout-like fish in the stream beside which we were camped, by driving them under the banks and there "tickling" them. The largest were about 8 inches long, dark brown above, golden below, and had irregular black patch-like spots on their sides. We had also shot one or two fine hares, which are plentiful in many parts of Tibet. They weigh about 6 lb., and are not unlike the blue hare of the Highlands of Scotland in their habits and appearance, but a great deal more wild, and much lighter in colour. With these luxuries, a bit of antelope-meat, and some wild-yak beef which were still to the fore and in good order (as meat keeps for any time in Tibet), some dried apricots from Skardo,¹ purchased at Leh, and a solitary tin of preserved oysters I had by some chance brought with me, we resolved to prepare a grand entertainment to celebrate our re-meeting with Captain Basevi. I here give our *menu*, to show what

¹ The chief town of Baltistan or Little Tibet.

may occasionally be accomplished in the way of *cuisine* even in these desert wilds, with the help of the cooking-pot and the broiler invented by Captain Warren, R.N., which I would recommend as an essential part of a Tibetan sportsman's kit.

Soda cakes.

Whisky-toddy.

Altogether a rare repast, such as even that world-known restaurant, Les Trois Frères de Provence, in the Palais Royal, would have found it rather difficult to provide—even without the disadvantage of having the kitchen-roof fall in during its preparation, as happened in this case, when the servants' little tent, in which our feast was being cooked, was blown down by a hurricane of wind and rain.

Here we parted from Captain Basevi—he proceeding on his way in search of scientific lore, we on ours in pursuit of the *feræ naturæ*. How little did the dear good fellow think, as, in excellent health and spirits, he cheerily bade us “Good-bye,” that we were the last of his fellow-countrymen whose hands he would ever grasp! Sad indeed was

his fate. In that inhospitable region to which his labours in the cause of science had led him, with not a friend near, and far, far beyond the reach of any aid save that of his native attendants, he was suddenly taken ill, and, after a few brief hours of suffering, passed away within eight days of his parting from us. He now lies at rest in the Christian cemetery in beautiful Cashmere, to which his remains were conveyed from Tanksee, where they had at first been interred.

Tibetan (hand) Prayer-wheel.

CHAPTER XVIII.

IN hunting the *Ovis Ammon*, or Nian as in Tibet it is called, the sportsman must expect to undergo a great deal of fatigue and frequent disappointment, and to have his patience and endurance tried pretty severely; but should he have the luck to secure even one really fine specimen, he may think himself well rewarded for all his trouble. One may wander for days and days over known good localities without seeing large rams; and when they are found, their "cuteness" is in proportion to their size, for even then they may have to be followed for many a mile, and, as likely as not, without getting a shot at them after all. An old ram *Ovis Ammon* is certainly the most wary and restless game-animal that exists—even the crafty Highland stag is a fool compared with him; and the ground he frequents is usually so open and bare as often to make approaching him there next thing to impossible. The ever-blowing wind, too, which is so shifty among these undulating uplands and ravines, frequently baffles the best of stalkers; but all this only makes the pleasure of success the greater.

A full-grown *Ovis Ammon* (or *Ovis Argali*) stands about twelve hands. The general colour of its pile—which is short, soft, and close—is a kind of light brownish-grey, growing much darker about the withers and fore-quarters, and slightly so along the centre of the back. In autumn it becomes darker all over, and more glossy. Under the chest

and belly it is much lighter—almost white, in fact. The legs, which are rather lanky and comparatively slight for a sheep, are also nearly white, with brown marks down their front. The stern and haunches are a pale yellowish-white. In old rams the hair in front of the shoulders is much longer than elsewhere, and stands out in a sort of greyish-white ruff. The muzzle is whitish and fine. Of tail there is hardly a vestige. The massive, deeply-creased horns are well arched upwards and backwards, their points curling round to the front beside the cheeks like cart-wheels. In weight the horns are not exceeded by those of any other known animal of the sheep tribe except the *Ovis Poli*, which inhabits the Pamir steppes and other more northern parts of Turkestan. The horns of the *Ovis Poli* are, however, not so thick, though they are very much longer, and have more curl and a much wider spread. About 40 inches long and 17 or 18 inches in circumference at the base, may be considered a fair average size for a good *Ovis Ammon* ram's horns, though they often grow bigger; but in almost all large specimens the tips are broken, which takes several inches off what the horns would be in length if perfect. A head of about this size weighs quite 40 lb., yet it does not look disproportionately large, nor does the animal appear to be at all inconvenienced by its ponderous horns. The ewes are considerably smaller than the rams, and rather lighter in colour. They carry comparatively short and thin curved horns, and have no white ruff. Strange to say, they are much less wary than the old rams, which is rather unusual with the females of the majority of gregarious wild animals. They drop one lamb yearly in spring. Although *Ovis Ammon* usually affect open and more or less undulating ground, they often ascend the sloping mountain-sides to very great heights; but they are not much addicted to nor adapted for climbing, like the other kinds of Himalayan wild sheep. In this respect the *Ovis Ammon* differs from the animal nearest approaching it in appearance—the “big-

horn" of the Rocky Mountains (*Ovis montana*), which is a good climber. During the rutting season the rams are much given to fighting, and their whereabouts may sometimes be discovered by the clashing together of their horns, which, when the air happens to be still, can be heard at a great distance, though the animals may be hidden from view. The *Ovis Ammon* is strictly a Tibetan animal, but, as it sometimes frequents the more gentle slopes on the eastern side of the Himalayas, it may be included among the game of those mountains.

This magnificent wild sheep, owing to the remoteness of its haunts and the difficulty in circumventing it when you get there, not to mention the grandness of its trophies when secured, is perhaps more prized than any other Himalayan game. In fact, the man who fairly stalks and kills his big ram *Ovis Ammon*, may consider he has gained the "Blue Ribbon," so to speak, of Himalayan sport.

On the 10th of July we left Lookoong for Chooshul, a fair-sized Tartar hamlet near some borax-mines, about eight miles southward of the Pangong tso, along the side of which the greater part of our three days' journey to it lay. Not a living thing was there to be seen, nor was there a sound to break the dead silence around this watery waste save the monotonous plash of the wavelets breaking along the sandy shore. From the unmistakable evidences about its margin, the water of this lake must be steadily receding; and Changter informed me that a long low rock which appears above water near its northern end was, within his recollection, quite invisible, and that each year it is gradually becoming more exposed. The water, although clear as crystal, is quite undrinkable, from having an intensely salt and bitter taste.

I had been told of a good locality for finding the big rams on the Chinese frontier eastward of Chooshul; but as the same ground had also been recommended to the Major, I relinquished my intention of hunting it at present in his

favour. After replenishing our supply of flour and changing our baggage-yaks at the hamlet, the Major proceeded to work the undulating hills in the vicinity of the Pangoor tso, a more elevated but much smaller salt lake than the Pangong, some ten miles east of Chooshul. As I was feeling rather "out of sorts," I delayed my start in a more southerly direction for a few days. Changter recommended my taking two or three dogs and their owner with me from here, as being useful for hunting nāpoo (*Ovis nahura*)—the burrel or blue wild sheep of the Himalayas—which he said we might also find on the ground he recommended my hunting over for *Oves Ammon*. They were ugly, half-starved-looking curs, but doubtless were well up to the work for which they were intended—being trained to hunt down their quarry as the ibex dogs are in the Cashmere mountains. It turned out, however, that I nearly had cause to repent having taken them, as will presently be seen.

After three days' rest I was fit enough to set out again, under Changter's guidance; so the baggage-animals were collected and packed. As yaks are sometimes apt to make free use of their horns, especially towards strangers, loading them is not always an easy job. The Tartars usually collect them in a ring, with their heads turned inwards, and their horns tied together until all are laden, when they are again set free and driven on their way.

Our route led over a low pass, or what looked a low one from the open level ground around Chooshul, which was already about 14,000 feet, but the ascent to it was pretty steep. On reaching the summit, a lonesome picture of flood and fell appeared stretching away beyond. About a mile from and considerably below us lay the Mirpa tso, an irregular-shaped sheet of dark, sullen-looking water, some four or five miles in circumference. Rising almost from its margin on every side were brown-coloured, rounded, and sterile hills, with nothing to break the dreary monotony of their appearance save a few patches of snow that lay near the top of

some of their long stony slopes, and in one or two of the deeper hollows of the gullies that ran down between them. The scanty tufts of herbage that existed on the sides of this huge natural water-basin, as it were, were rendered almost invisible by distance, except in a few low and more level spots, where the moisture, derived either from springs or from trickling streamlets, had given the scraps of turf there a most vivid green, which was quite a relief for the eye to rest on.

After a short time spent in contemplating this joyless solitude, we descended to the shore of the lake. Not a breath of the usual wind was then stirring to ruffle its placid surface, which resembled a sheet of polished steel. The dull grey light of a cloudy day, and the solemn silence that reigned supreme, combined with the bleak and dismal aspect of the surrounding hills, were such as to induce a feeling of utter loneliness which was almost irksome. The men with me stretched themselves out on the dry white sand that bordered the lake, and were soon fast asleep. Even the pony seemed to feel the depressing influence of the profound stillness, as he stood listlessly there with drooping head and closed eyes. The only signs of life or motion to be seen were exhibited by the dogs as they tugged and gnawed at some dry bits of skin that partially covered the sun-bleached bones of a dead animal that lay close to the water's edge. If from this inadequate sketch the reader can picture it to himself, such was the ground in which I hoped to find the objects of my present search.

I was not sorry when my meditations, which under the circumstances were not of the liveliest order, were interrupted by the sound of footfalls, and on looking round, I saw my cook approaching with the men who carried the *kittas*¹ containing breakfast. After appeasing my appetite, which had not been so much affected as my spirits, we skirted along the shore of the lake, and camped at its southern end.

¹ Baskets made for carrying loads on the back.

For the two following days we wandered high and low over these desolate hills, which I found to be a great deal steeper than they had at first looked. Carefully did I scan every hillside, glen, and corrie through the telescope, without a living thing appearing in its field except kiangs, or an occasional marmot as it sat basking near the entrance to its burrow. Not even a fresh mark of an *Ovis* did we see to encourage us. The animals had evidently shifted their ground, so we resolved to follow their example.

With this intent, next morning, leaving instructions for the traps to be brought on some distance behind us, in case of our meeting with game, we were on the move shortly after dawn. We had crossed a high ridge, and were descending a gentle slope beyond it, when one of the dogs, which, being little more than a puppy, his owner did not think it necessary to tie up, suddenly showed signs of more knowledge of his calling than he had been given credit for. This young beast, that answered to the name of Lukkur—or rather ought to have done so—was now drawing ahead, apparently on the scent of something, and neither the persuasions nor the threats of his master had any power to stop him. We had not proceeded many yards when, on the face of a low spur that had hitherto been hidden from our sight, we descried the cause of Master Lukkur's movements. A flock of seven male *Oves* were standing huddled together, evidently watching the dog, which had disappeared in a hollow lying between them and us; and almost immediately the sound of his bark was followed by the herd scampering wildly over the crest of the spur. My feelings at that moment can easily be imagined. My anger and vexation were so great, that I could with difficulty refrain from shooting the confounded young beast as he came trotting back after the mischief he had done. There was, however, one chance left, though a very poor one. Fortunately the dog had not followed the animals far, and their attention had been so much taken up with his movements, that they

in all probability had not observed ours. We therefore resolved to follow them, on the chance of again finding them.

By the greatest good luck we overtook them about a mile beyond where they had disappeared. Although some of them had begun to feed, they were still in a restless state; so the only thing to be done was to patiently watch them as they kept slowly moving up the hillside. At last one of them lay down, and the rest soon followed his example. Crawling backwards until we were well under cover, we again got on our feet, and as the wind was favourable, we resolved to try and get above them. To effect this was by no means easy, as the face of the hill we had to climb was awfully steep, and composed of nothing but loose sharp fragments of rock, that afforded most uncertain footing, and frequent stoppages were necessary to take breath.

On reaching what we considered a sufficient height to be well above the place where the flock was lying, after a few minutes' rest we had to resume the stooping and crawling process for some distance. But notwithstanding all our caution, the wily animals detected us in some manner, for the next sight I got of them was at about 200 yards, as they were galloping away up the sloping hillside. Sighting for that distance, and making for a lump of rock a few yards in front that offered a good rest, I placed my cap under the rifle and waited until they stopped, as I expected they would do before going far, to look back. Taking a full bead on the one I thought had the largest horns, I let drive. Away they went in a cluster over the rise above them, leaving the lord of the flock half dragging his hind-quarters after him as he in vain tried to overtake the rest. I gave them a parting salute with the other barrel as they topped the rise, which compliment they failed to acknowledge. This was a lucky chance and no mistake, as the distance must have been quite 250 yards. The poor brute

dragged himself on his haunches for fully a quarter of a mile down the other side of the hill before his strength failed him, and on our approach raised himself on his fore-legs and menaced us with his horns. Although he was a full-grown ram, measuring about twelve hands, his horns did not turn out to be so large as they had looked at a distance.

By the time we got back over the hill, the baggage-yaks had arrived at the place where we had left the pony and dogs below. As the country about looked promising, and there was water at hand, I decided to camp here for a day or two. Good as it seemed, and although we worked hard over it, as well as a more distant beat, to reach which we crossed a rocky ridge that must have been considerably above 19,000 feet, our success was no better here than on our last ground. We saw only four *Oves*, which the spy-glass spared me the trouble of going after, by showing them to be either ewes or very young males. How many a weary and useless mile does a good telescope thus save! We also came across a black wolf, but he was too far out for a shot, and his long slinging trot soon took him out of sight. The only thing I emptied my rifle at was a marmot, as it sat up whistling away, near the mouth of its burrow, not far from my tent. It was somewhat smaller than the Himalayan variety, and of a uniform yellowish-grey colour, and appeared to be identical with the Alpine marmot. The Tartars consider marmots excellent eating, and probably they are so, though I could never bring myself to try them. When we happened to encamp near their burrows, of which there are generally a number together, like the prairie-dog "cities" in America, our men would sometimes secure them by smoking them out of their holes, and killing them with sticks and stones. To cook them they were first singed bodily in the fire to remove the hair, and then cut up and boiled, skin and all.

The Major and I had arranged to meet at a place called

Numa, on the Indus, where it is fordable or ferryable, according to the season, as we should there have to cross it on our way to the Hanlé country, where we intended to try our luck after the goa (Tibetan gazelle). As my camp was at an elevation of over 17,000 feet, calculated by boiling-point thermometer, and was fearfully cold and windy, I was not sorry to turn my steps downwards in the direction of Numa, which we reached in two days:

The Major had seen a good many big *Oves Ammon* on the ground he had been over, but unfortunately had killed none, so we decided that I should return there with him, as he said there was plenty of room for two guns. I need not, however, recapitulate all the vicissitudes and disappointments experienced during the several days spent in endeavouring to circumvent these most wary animals, without even the satisfaction of getting a shot, so let us return to Numa, and thence continue our wanderings.

CHAPTER XIX.

SOUTH of the Indus, in the wild, almost uninhabited districts of Hanlé and Rookshu, there are good localities for *Oves Ammon*; but as Changter refused to budge an inch farther than the river, and we were unable to get any one else who was able or willing to show us where to find them, we resolved to make direct for the little hamlet of Hanlé, there to engage a guide who had been recommended to the Major. Thence, after hunting up the goa, or Tibetan gazelle, in the country beyond it, we proposed returning with our new guide to again try our luck at the big sheep.

Hanlé, which we reached in three days, is the chief and almost the only inhabited place in the extensive district of the same name.

To the south and east of Hanlé, stretching away for some twenty-five miles to the confines of the Chinese dominions, lies a desolate expanse of rolling uplands and ravines with an exceedingly limited amount of vegetation scattered over them. These stony downs, as they may be termed, the altitude of which ranges between 15,000 and 17,000 or more feet, are a favourite haunt of the goa.

Standing from 22 to 24 inches in height, on most delicately formed limbs, the goa, or Tibetan gazelle (*Procapra picticaudata*), is perhaps one of the most graceful little creatures that exists. Its general colour is a pale brownish fawn; the head is light fawn, but in old bucks the hair on the forehead and about the roots of the horns is white. On

the stern is a pure-white disc bordered distinctly with a yellowish-brown mark. The tail is dark brown, and very short. The horns, which in a full-grown buck are 11 or 12 inches long, are more curved than those of the Indian gazelle; they are closely annulated to within about 2 inches of their tips, where they turn slightly upwards, and sometimes inwards, and from being planted rather forward, and springing well upward in their curve, they give the beautifully formed little head a most jaunty appearance. The doe almost exactly resembles the buck, except that she carries no horns. In this respect she differs from the female Indian gazelle, which has small horns. I do not think the goa's sense of smell is quite so acute as that of other Tibetan game-animals, but this is compensated for by its wonderfully keen sight. The nature and height of the ground it frequents I have already described.

On the day we left Hanlú, as we were trudging along in advance of our baggage-yaks, we got our first sight of a buck goa as he beat a hasty retreat over some distant rising ground.

The following morning we were both afoot very early, each taking a separate line of country; whilst our traps were to follow direct to our next camping-place, in the vicinity of which the Major's guide said there was a chance of finding *Oves Ammon*.

Phœbus was just waking up as I topped the brow of a rise and carefully looked over, when I noticed that the light of his countenance was shed on two small objects that stood on the face of an opposite slope. They did not look much like stones, though they were just as motionless. Pointing them out to a Tartar who was following me, he merely ejaculated “Goa!” and instantly squatted. On taking a spy at them through the glass, they turned out to be two fine bucks; but the sharp-eyed little creatures, notwithstanding the distance we were from them, had already detected our heads—for they could have seen nothing more

—and were gazing straight towards us. Presently one of them went bounding and skipping away up the slope, sometimes turning round for a few seconds to look back, until he at length disappeared over its brow. His companion continued to gaze ; but as we kept perfectly still, he at last appeared to think that he must have been mistaken in his suspicions, for he quietly turned round and began feeding. In a short time, however, he became restless, and after wistfully looking about him, as if he had suddenly missed his companion, trotted off in the direction he had gone, hardly stopping until his form appeared on the skyline at the top of the slope, and after a good look around him, he too moved out of sight.

Up we jumped and followed at our best pace, which, in the thin air of an altitude of well over 16,000 feet, could not be very fast, although the ascent was quite gentle. On nearing the brow I made for some large stones, from behind the cover of which to view the ground beyond, and at the first glance had the satisfaction of seeing both the bucks feeding within 130 yards of where I lay. Singling out what I thought the better of the two, I luckily dropped him in his tracks. The other sped off for a short distance and then pulled up. If I hit him with the second barrel, as, from the sound, I thought I had, it must have been too far back in the body, for he galloped off and was lost to view in a dip of the ground. Exchanging the empty Whitworth rifle for another, a breech-loader, I followed after the buck, and found him standing at the bottom of the hollow ; but before I could get my aim he bounded off, though only to a short distance, when he again stood and offered a fair broad-side chance. I pressed the trigger—click ! a bad cartridge, thought I, and cocked the other hammer ; click ! again, and away trotted the goat. I opened the breech and found nothing but daylight in the barrels : dolt that I was, I had forgotten to put in the cartridges.

As the buck had taken a direction exactly opposite to the

one I wished to go, and my Tartar guide said it was a long way to our next camping-place, I abandoned further pursuit, as, even if wounded, the animal might have led me a long and a hungry chase, for I had stupidly neglected to take any provender with me that morning. We therefore returned to pick up the buck I had killed, and the Tartar having shouldered him, we made the best of our way in the direction our yaks had gone, overtaking them in time for a late breakfast, to which I felt quite ready to do ample justice.

After working over this ground from morning to night for two days, seeing only the ubiquitous kiang, a few female goa with their young at foot, and a fine pair of horns attached to the sun-dried remains of a ram which had probably died of starvation in winter, we shifted camp towards the source of the Hanlé river, near the Chinese border. Several more goa were seen on our way there; but all being "hummel," I refrained from shooting at them lest the firing should disturb better game, though I would fain have had some more venison in camp, our Tartars' appetites being voracious.

As this locality was considered a sure find for goa, the Major and I started very early next morning in quest of them. He took the right and I the left of a fairly wide valley, towards the head of which there was a pass leading over from the Hanlé province, which is under the rule of the Maharajah of Cashmere, into the Chinese-Tibetan territory of Chumurti, we having previously arranged that the first of us to reach the summit of the pass, some seven or eight miles distant, should await the other's arrival there.

The scenery of the upper part of this valley was perhaps of a grander character than any we had as yet seen in Tibet. This was owing to the mountains on both sides looking more rugged, precipitous, and snow-clad than usual, and from there being at the head of this wild glen a confluence of two fine glaciers, from the base of which the Hanlé stream issued, and thence flowed in a broken, tortuous torrent, between

banks of bright-green turf, down through the otherwise almost verdureless valley. Our pass, however, led over a depression at the top of a high stony acclivity on the left of the glen, where the steep mountain-slopes on either side approached each other more closely, five or six miles short of the glaciers.

Among some broken ravy ground in the valley I found a herd of several goa, and farther on a solitary doe. The former made off without giving me a chance; the latter, although offering an easy shot, I did not molest, for which she afterwards served me a good turn in a rather singular manner.

On nearing the top of the pass I observed several men sitting behind the shelter of a big stone. These, my Tartar companions (one of whom was our interpreter Kurreem) informed me, were "Cheen log" (Chinese people); who were keeping watch and ward there, having probably heard that two Europeans were encamped in the vicinity. As we approached, they retired out of sight; but on arriving at the summit, one of them suddenly reappeared and squatted himself on the ground some distance from us. On getting up to him, a rather animated conversation was commenced between him and my men, who informed me that he was remonstrating against our proceeding any farther. On it being explained to him that we had no intention of invading his country, he seemed satisfied; but on my moving forward a short distance down the gently sloping Chinese side of the pass, in order to obtain a better view of the country beyond it, I fancy his suspicions were aroused, for, although he offered no further remonstrance, he proceeded to tell us, with a view to intimidation I suppose, that some more men would soon be up to join him.

I now sat down to wait until the Major should arrive. A quarter of an hour had scarcely elapsed when the clatter of horses' hoofs, and the jingle of the little bells that are always attached to the Tibetan bridles, were heard coming up the

pass, and presently three or four Tartars, mounted on capital ponies (for which Chumurti is famed), hove in sight. One of them, a rather well-dressed corpulent individual, turned out to be the head functionary of the Chumurti province. They galloped by without at first observing us as we sat amongst the rocks and stones; but on suddenly catching sight of us, the stout party, seemingly in a high state of excitement, wheeled round his pony and rode straight towards us, shouting and waving his arm in the air, as if he were leading on his army of Tartars, who had not as yet arrived in sight. Very soon, however, parties of two or three men at a time began to appear in the most marvellous manner, as though they had suddenly arisen out of the ground, like "Clan-Alpine's warriors true," until a small crowd, numbering about forty or fifty, had collected around us. Where they had all come from so quickly it was impossible to conjecture, for the top of the pass was as desolate-looking a spot as a height of, I should say, nearly 18,000 feet could make it. A dirtier or more ill-favoured lot than the generality of them were, I never set eyes on. Had they carried any other weapons than their wool-spindles, and had I not been aware that the resistance offered by these borderers to European travellers or sportsmen attempting to cross the Rubicon of the Chinese Empire in Tibet was usually more of a passive than a forcible kind, I should have felt considerable relief of mind at being reinforced by the Major and his men, who, having crossed the stream below the pass, soon appeared on the scene of action. I took the precaution, nevertheless, to keep my rifles within reach, in case of any attempt being made to appropriate them.

Whilst the Major and I sat there making futile attempts at polite conversation with the stout potentate, who of course could not understand a word we were saying, his myrmidons were gesticulating and clamouring away in an excited manner, quite as unintelligible to us, with one exception, which was a kind of pantomime of the act of binding the hands behind

the back. All this, we afterwards learnt, was inveighing against the Hanlé men for taking us up to the pass, and threatening to bind the Major's guide, whom they considered the arch-offender, hand and foot, and drown him, as they put it, for doing so. Their having suggested this mode of disposing of him struck me as being scarcely compatible with the means, considering that, as far as we could see, there was not water enough to drown a flea in nearer than the river far down below. When we arose to depart they all collected around their portly leader, and, as we retired, followed us for a short distance, still vociferating loudly, and finally they saluted us with a parting derisive jeer, evidently under the impression that they had frustrated an attempt on our part to enter their country. At hearing this, such was the Major's ire, that he was for turning back to forcibly resent what he considered an insult, and I had some difficulty in persuading him that, under the circumstances, discretion was the better part of valour.

On our way back to camp, I thought I would again look up the place where I had in the morning seen the solitary doe, as she did not then seem to be at all scared. This time I was determined not to lose another chance if she gave me one, as our supply of animal food was done, and bucks were scarce. I had not much difficulty in finding her again; but now she seemed to have some suspicion of my deadly intent, for on each occasion that I tried to steal a march on her among the broken ground, she would move off just out of range. This sort of thing had happened for the third or fourth time, and I had just topped a rise over which she had gone, when, instead of seeing the doe, up sprang two fine bucks from a hollow in front. As I felt pretty sure that before going far they would stop to look back, I instantly lay down, got my elbows well planted on the ground, and the rifle levelled for a steady shot. Sure enough, they pulled up at about a hundred yards. There was little to choose between them, so I took the one that offered the better mark,

and dropped him on the spot. The other trotted on some twenty yards, and then turned to look back for his companion. I had only his chest to aim at, but fortune again favoured me, for he too went down, never to rise again. Great was the astonishment of my Tartar companions when, on coming up, instead of finding, as they expected, that I had shot the doe, or perhaps missed her, I showed them a dead buck, and still greater was it on my pointing out a second lying within twenty yards of him ; for their surprise was so great at seeing even one dead buck, that they had never thought of looking for another. But where was the doe ? She had vanished, and her having thus been fortuitously the means of my finding two such beautiful bucks, after my forbearance towards her in the morning, was really a curious coincidence ; for had I shot at her then, I should never have got them. The Tartars soon shouldered the game, and we bent our steps towards camp rejoicing. Both pairs of horns were just over a foot long.

The Major got back soon after me. He had found no goa, but had seen two black wolves, which unfortunately he was unable to get a shot at. During our absence it appeared that the camp had been invaded by some of our mounted friends from the pass, at whose unexpected advent, our Indian domestics informed us, the Hanlé yak-drivers seemed much exercised in their minds.

We now returned to Hanlé by a different route to the one we had travelled from it. A few goa were seen, but nothing was bagged except some hares. It had been our intention to hunt up the big sheep on the ground north of Hanlé ; but man proposes, and the *Ovis Ammon* very often disposes, at any rate of itself. We now learnt that this ground had just been hunted over by the two Changchenmo sportsmen unsuccessfully, owing to the *Oves* having this season left it. When too late we had discovered the mistake we had made in not persevering longer in our pursuit of the splendid rams we had seen north of the Indus,

Only remaining one night at Hanlé, we thence took a westerly direction, and after traversing a long level stretch of dreary country, which appeared quite destitute of any sort of animal, and almost so of vegetable life, we camped late in the afternoon on a patch of greensward in a wild gorge east of the Lanak la, which rises between the Hanlé and Rookshu districts. Next day we crossed the pass, which is somewhere about 17,000 feet high; but, as is so often the case with Tibetan passes, the gradient was easy. Some distance down on its western side, among the broken stony slopes, hares were numerous, but generally so wild as to

Lama Monastery at Hanlé.

afford better rifle-practice than sport for a shot-gun. Here we found perfect parterres of sweetly-scented, pale-blue flowers, with which our Tartars at once proceeded to deck their caps, after the manner of the Swiss mountaineers with the Alpine roses. Notwithstanding the sterile aspect of the country, the variety of beautiful wild flowers growing in many Tibetan localities would delight the heart of a botanist. On a little isolated patch of green beside the Pangong lake, where we stopped one morning to breakfast by a spring, the ground was covered with a plant having flowers like a small

pink geranium. In the sterile wilds of Changchenmo, on damp spots, at an altitude of quite 17,000 feet, I sometimes found whole beds of a kind of polyanthus, with delicate pink flowers, and usually, strange to say, in places where there was scarcely a blade of any other vegetation to be seen. Another curious fact I noticed was, that almost every weed growing on these high wastes had a highly aromatic perfume.

Another day's journey brought us to a spot called Ooti, a few level acres of bright-green turf moistened by the snow-drainage from the neighbouring heights, and thickly besprinkled with flowers, principally of a yellow hue. These poor little Tibetan flowerets have so few places to flourish in, that when they do find a favourable spot they seem to take every advantage of it. Here we found the tents of one of the Changchenmo sportsmen pitched. Their owner returned to them late in the evening, bringing with him a fine buck goat which he had killed on the bare undulating wilderness in the neighbourhood of this little oasis. We clubbed dinners, and sat up till a late hour comparing notes and recounting our respective experiences.

The following morning, as we traversed the desert tract westward towards the Tso Morari, we saw one or two packs of a large kind of pinnated sand-grouse, which, I was told, frequent these bare uplands in considerable numbers at this time of year. They were about the size of the large migratory sand-grouse found on the plains of India in winter, but their plumage more resembled the smaller pinnated variety. I found them very wild, and only got one long shot, which fortunately brought down a bird.

That evening we pitched our camp in a sheltered nook near the southern end of the Tso Morari, which is 15,000 feet above sea-level, and almost, if not quite, the highest of known lakes in the world. Although much smaller than the Pangong tso, being only about 15 miles long by 5 or 6 broad, it has even a grander appearance, from the more precipitous nature of some of the adjacent mountains. It has

the same strangely intense blue colour so characteristic of all Tibetan lakes when rippled by wind, and as its water is not salt, there is a certain amount of verdure here and there along its margin, and beside the streams that flow into it, which gives a pleasing variety to its otherwise barren scenery. The surrounding mountainous country is desolate to a degree, there not being a human habitation within a radius of at least 40 miles of it, except the miserable little hamlet of Karzok, with its small monastery situated on its western shore. The water, to me, seemed perfectly good, although rather flat, so to speak, to the taste; but the Tartars have an objection to drinking it. Although there is a large amount of drainage into the lake, there is no visible outlet from it. This is a remarkable fact; and evaporation alone, one would suppose, could hardly account for the disappearance of the constant and abundant supply of water from the great quantity of melted snow draining into it off the neighbouring mountains.

On our way to Karzok along the shore of the lake, we got numerous shots at wild geese of the bar-headed kind, and as they had young goslings with them, I concluded they bred in the vicinity. Fortunately the strong wind was blowing shorewards, as most of them dropped on the water and we had no dog to retrieve them. The old birds were dreadfully tough, and even our Warren's cooking-pot failed to extract much flavour from them when made into soup; but the goslings were much more palatable.

There now only remained about a fortnight before we should have to commence retracing our steps across the Himalayas. This I resolved to devote to a final search for *Oves Ammon* in the vicinity of the Tso Kar, better known as the Salt Lake, three or four days' journey to the north-west of Karzok.

Leaving the Major at Karzok, where he preferred to remain shooting wild geese and trying his luck on the ground about the Tso Morari, the second evening found

my camp pitched on the east side of the Kazura la, at an elevation of about 17,500 feet, calculated by boiling. In the grey of the following morning I was very loath to turn out into a temperature of twelve degrees below freezing (and this in the month of August), although my sleep had not been either of the soundest or most comfortable kind, from my being unable to respire freely in a recumbent position at such a height. The cold, too, was dreadful, as the wind blew through the thin canvas of the little tent, which I had exchanged for my own blanket-lined one with my two Indian domestics, who felt the severity of the climate much more than I did. I must confess, however, that this was not done out of pure philanthropy: there was a certain amount of selfishness in it, as one's own comfort on a trip of this kind so much depends on keeping one's servants in health and good-humour.

About two hours' slow walking—for I was now afoot again, having sent back the pony from the Indus with Changter—took us to the top of the pass, on the farther side of which the Karzok men had told us we should find an encampment of Rookshu people, where a guide for the locality could be procured. On and on we trudged over the bare hard ground, under the glaring sun, and against the everlasting cutting wind, for hour after hour, not meeting with a sign of life except a few marmots, and the cheerless relics of a Tartar camp in the shape of smoke-blackened stones and dilapidated "pullas,"¹—all was silent solitude.

Towards the afternoon we topped another rise, from whence we got a fine view of the Tso Kar lying far away below. Situated in the middle of an extensive barren

¹ A "pulla" is a low wall built of loose stones, which the Tibetans build round the bottom of their tents, or more frequently in the open, as a protection from the wind; for these hardy nomads seem to care little for any shelter except from the cruel biting blast. We always piled large stones, of which there was never any lack, round our little tents, if only to keep them from being almost blown away.

valley, surrounded by arid brown hills, the Tso Kar is, I think, the least interesting, as far as appearance goes, of any of the larger lakes of this part of Tibet; and to increase its dreary aspect, the shore, for some distance from its crooked margin, is covered with a white saline efflorescence, from which a most abominable glare is reflected. It is curious that, in the same valley, and only about a mile or so from this salt lake, there is a smaller sheet of fresh water, bordered to a certain extent with green turf, presenting a remarkable contrast to its salt neighbour. On the fresh-water lake numbers of wild-fowl congregate, affording some sport for a shot-gun. The mountains in the vicinity hold both *Oves Ammon* and nāpoo, and the valley, I believe, a few goa, if one has the luck to find them there.

After a gentle descent for some distance, a strange scene suddenly presented itself. Instead of a small encampment, as I had expected to find, there appeared a perfect city of black blanket-tents, pitched on either side of a rivulet that flowed through a long, narrow, comparatively low-lying valley, the bottom of which was carpeted with bright greensward. There must have been considerably over a hundred tents. It seemed as though the whole nomadic population of Rookshu were collected on this meadow-like spot. Vast herds of sheep, goats, and yaks were scattered over the neighbouring heights, where the wild yodling kind of hulloo of the Tartar herdsmen and the barking of their dogs was heard on every side.

This did not look much like a locality near which to find such wary game as *Oves Ammon*, and I could not but feel that I had been regularly humbugged by the Karzok men. Of one fact I was now more than ever convinced, that as a rule, to which there may be occasional exceptions, the sportsman, in this part of Tibet at any rate, must undergo the vexations and disappointments of a first season's personal experience in that country to ensure success on a second visit.

Unpropitious as matters looked, I was nevertheless determined to give the ground a trial; but after several days of severe work, during which I must have sometimes been considerably over 19,000 feet, I saw nothing but a flock of nāpoo, a few *Oves Ammon* ewes with lambs, and one or two young males, at which latter I did not attempt to shoot lest I should disturb better ones. Kiangs were numerous as usual, but of course were never molested. The Tartars, however, being hippophagous, did not seem at all to appreciate my thus abstaining from horse-butchery. One evening I came suddenly on a brood of snow-pheasants, large game-looking birds of a general light-grey colour, with a whitish head and breast.¹ They were at first unwilling to rise, but made such good use of their legs that I had to put my best foot foremost for some distance to overtake them before I could get a shot. At such a height this exertion, slight as it was, so completely pumped the breath out of me that I was only just able to loose off both barrels into the "brown" of the covey as it rose. I had not another yard left in me to secure the runners; but my Tartar attendants, who had wisely followed more leisurely, gathered the old hen and three well-grown chicks. The old one proved rather dry and tough, even after many days' keeping; but the chicks were as tender and well-flavoured birds as I ever tasted.

It was now time to return to Karzok, as I had promised to meet the Major there on a certain date. The cold, too, at the great heights I had camped during the last few days, had become unpleasantly intense, owing to frequent snow-storms and to the sun having been obscured by clouds. There was, however, no lack of sunshine on the day I started for Karzok by a short cut across the mountains,

¹ This bird, although generally termed a pheasant, is really a partridge, sometimes called the "gigantic chuckor." There are two kinds, that found on the southern slopes of the Himalayas being a good deal smaller than the Tibetan variety. They are found only at very high elevations, far above the limit of forest.

where the ground was completely covered with new-fallen snow, off which the glare was almost intolerable. For several miles our way led gently upward through a narrow glen, which wound along between rolling rounded hills. The crisp snow, that at first merely crunched under our feet, became deeper and more laborious to trudge through as we gradually ascended. Not a vestige of any living thing was visible in this white solitude, save here and there a tailless kind of rat,¹ that, scared at our approach, would dart away over the snow, and, with a shrill eerie chirp, suddenly vanish; and one little bird, something like a robin, that followed us for a long way, flitting and hopping from stone to stone in the ice-bound brook beside us, as if courting our companionship. So profound and deathlike was the solemn hush that brooded over mother earth as she lay wrapped in her snowy shroud, that one was almost startled at the slight rustling noise caused by the slipping of melted snow from off some neighbouring rock; for, in the still frozen air of that high silent region, fancy almost led one to imagine the sound resembled the mysterious whisperings of invisible beings whose sanctuary we were invading. Even on emerging from this dismal glen upon more open ground, nothing met the weary aching eye but a vast lone wilderness of white undulating hills, and, more distant, domes and pyramids of snow. At last we reached the culminating point, and began to descend,

¹ Colonel E. Smyth, an excellent authority on Himalayan fauna, considers this little animal, which is about the size of an ordinary rat, and of a dirty white or light fawn colour, to be a kind of rabbit. He says they are inquisitive little creatures, and by no means addicted to shyness, as the following experience of his concerning them will show:—

“I was once resting myself on a cairn at the top of the Niti pass. Everywhere around the ground was covered with snow, except on this cairn. One or two of these little things soon appeared from among the stones; and as I sat perfectly still to watch them, they came up to me and began nibbling at my boots.”

The Niti pass, I may remark, is nearly 17,000 feet high, and well above the limit of any visible sort of vegetation.

when it was quite a relief to look down on a bit of dark-blue water of the Tso Morari some 2000 feet below us, cold and cheerless though it appeared as it lay amidst mountains which were now draped in virgin snow almost to its margin.

The Major's luck with the rifle had been no better than mine. To tell the truth, we were both getting a little tired of toiling after game day after day from morning to night over these desolate regions to so little purpose; so next morning we were not sorry to retrace our steps along the shore of the lake, *en route* for the verdant and forest-clad slopes of the Himalayas. On a marshy bit of ground, near the end of the lake, I killed two specimens of the ruff. Another British bird that we frequently saw up here was the common magpie; also that cosmopolitan bird, the hoopoe.

Next morning we forded the Parang, a turbid broken flood of melted snow, which, as is usual with these capricious snow-fed torrents of Tibet, was only passable at an early hour. For three days we trudged up the valley of the Parang, a seemingly endless narrow glen, totally destitute of vegetation, and closely hemmed in by steep stony landslips and precipices of a brownish-yellow hue, rising stark and gaunt one above another to a stupendous height, like gigantic stair-steps, save where the V-shaped cleft of some lateral gorge disclosed the broken termination of a glacier, or a towering white mountain-summit.

The Parang la, with its glaciers and perpetual snow, is quite in keeping with the wild approaches to it on either side. It is perhaps as savagely grand as any of the passes that are ordinarily used as highways for crossing the "divide" or backbone, as it were, of the Himalayan range into Tibet, as well as being one of the highest and most arduous to traverse. And certainly, from my experience of it in September, when its difficulties are supposed to be at their minimum, I can quite imagine it to be the latter. Its

height is about 18,600 feet, and it is seldom, if ever, open before June, and generally becomes again impracticable to cross about the beginning of October. On our arrival at Leh in June, we found several Indian servants of some travellers who had just come over this pass, laid up there in a pitiable plight from frost-bite; one of them had lost many of his toes, and his companions were little better off.

The evening previous to our crossing, we camped a short distance below the foot of the glacier that extends down almost from the summit of the pass for some four or five miles on its northern side. Snow began to fall thickly just before dark, and continued to do so, more or less, during the night. In the morning the weather at first looked rather promising, but the tents were frozen as stiff as boards, and were so incrustated with hard snow that we had to delay our departure until the sun, of which we only got an occasional glimpse, should thaw them a little. After our breakfast, which we managed to cook over a smoky little fire made of the few remaining scraps of wet fuel which, with considerable difficulty, we had coaxed into burning, we loaded the yaks and started just as it again began snowing more thickly than ever. The limited supply of fuel we had brought up with us was done, and the poor yaks had already been fasting for two days or more; besides this there was some fear, if the snowstorm continued, that the pass might become permanently closed for the winter: we therefore determined, under any circumstances, to make an effort and push over it at once into Spiti.

For more than six weary hours did we toil up against the almost blinding snow and piercing wind that chilled us to the very marrow, although the distance to the summit was only six or seven miles. It was truly wonderful to see the way in which the yaks struggled through the deep snow, and scrambled over places which were often difficult, and sometimes dangerous to traverse. Nothing could have exceeded the powers of endurance evinced by these animals,

which were game to the backbone and as sure-footed as goats. One of them, notwithstanding, lost its footing on a steep slope of *névé*, and went rolling and sliding down until it was fortunately stopped by a friendly rock, otherwise it must have disappeared for ever under the glacier, and with it my dear old Whitworth rifle, which, among other things, it was carrying. On regaining its feet the creature merely shook itself, and on being disentangled from its load soon clambered up again.

For the last three miles of the ascent our way was over the glacier, where we waded and floundered through the soft fresh-fallen snow, with an occasional dive into it up to the middle, as we followed in the steps of our Tartar leader, who, in order to avoid hidden crevasses, cautiously sounded the way with his long mountain-pole. Here we experienced a regular *tourmente*, for, besides the falling flakes, the dry drifting snow was whirled up into our eyes and nostrils by the freezing blast, causing a suffocating sensation which was most trying, and the cold was so intense that my beard, from my breath on it, became a mass of ice, and was frozen hard to my coat.¹ Whilst on the glacier all the marks we had to indicate the right track were the giant outlines of the white eminences rearing up on either side, and these only occasionally loomed dimly through the driving snow. Never shall I forget the ludicrous picture of utter misery presented by my Hindustani cook as he sat resting himself on a bank of snow, his head closely enveloped in a black blanket, and his beard covered with icicles. Blank despair was depicted on his face as he gazed ruefully, through a pair of green goggles, on the bewildering scene around him. Right glad

¹ With reference to what I have already said concerning the effects produced by rarefied air under different conditions, I may here mention that when crossing this high pass, which is approached from the south by a very steep ascent, and is flanked on both sides by high eminences, neither my companion nor myself felt any of the more disagreeable sensations, such as headache and nausea, even under such circumstances as might have been expected to induce them.

were we all to at last reach the top, where we sat down for a short time to rest our weary limbs and to admire the grand landscape before us ; for the snowstorm had passed over, and the blue mountains of Spiti were gradually becoming disclosed to view through the broken masses of cloud and mist that came rolling up from below.

But our day's work was not to end here, for the descent on the Spiti side of the pass was so steep and rough, that even after we got clear of the snow the track was almost worse than if covered with it. As the Major remarked, "it was macadamised with a vengeance." Such a howling wilderness of sharp pinnacles of rock, and bare, rugged, perpendicular cliffs, piled tier upon tier to an appalling height, as flanked the stupendous cañon down which our route lay, I never beheld.¹ Some of the lofty fantastic-shaped summits bore a striking resemblance to ruins of gigantic towers and turrets. As the last rays of the sun, sinking behind the mountain-tops, shed a parting gleam of golden radiance on these aerial castles, rock-spires, and snow-crowned peaks, leaving the profound depths of the abyss beneath wrapped in gloomy shade, the effect was truly magnificent ;—scenery altogether so sublimely wild, so awe-inspiring, and on so vast a scale as to be quite beyond description, and almost beyond conception. Dame Nature must indeed have been in a terrible mood when she fashioned such awful works.

When darkness compelled us to call a halt, we were still several miles short of the usual camping-place ; and as there was not a blade of grass in the vicinity, the poor yaks had to fast another night. Fortunately we found sufficient fuel for cooking purposes.

A short but very stiff walk on the following morning up

¹ The Grand Cañon of the Yellowstone, in Wyoming, with its fantastic features and profound depth, is the nearest approach to it in appearance I know, though the American cañon falls far short of it in magnitude and savage magnificence of surroundings. And doubtless there are many other such gorges in the higher Himalayas that quite equal, if they do not surpass, this one in savage grandeur.

through another wild gorge, brought us to our next camping-ground, on the heights above which was the locality for nāpoo, recommended by the sportsman we had met at Karzok. Some of our Tartars were half-blind from the effects of the previous day's snow on the pass, notwithstanding their having improvised kind of goggles of wisps of black hair pulled from their yaks' tails, and tied loosely over their eyes, none of them having brought the woven yak's-hair spectacles they often use on such occasions with them. I found one man sitting by the wayside endeavouring to extract blood from his nostrils with the point of his knife, at which surgical operation he implored me to assist him, at the same time handing me the knife. A good punch on his proboscis would, I thought, have been much less dangerous, and just as effectual, as regarded relief to his eyes. Our Indian servants had not suffered so much, owing to their having been provided with green goggles. There was plenty of grass here for the famished yaks—and how they did pitch into it! Never have I seen animals making such good use of their time and teeth. But, to use a much hackneyed, but in this case a rather appropriate phrase, *revenons à nos moutons*.

Although the wild sheep here called nāpoo are numerous in many parts of Tibet, I have hitherto made but little mention of them, as I seldom hunted expressly for them, owing to my time having been fully occupied in searching for other game not found on the south side of the Himalayan chain, specimens of which I was then more anxious to secure. Stalking burrell, as these animals are called in the Himalayas, is really splendid sport on ground where they are fairly plentiful.

A full-grown male nāpoo or burrell (*Ovis nahura*) stands about 33 inches at the shoulder usually, but its size seems to vary in different localities. The thick arching horns, which spread laterally and curve downwards, and slightly backwards near their points, occasionally attain a length of

30 inches, or even more, and are about a foot in girth. The beautiful skin, with its thick elastic pile, is of a bluish-grey, bordered with distinct jet-black and pure-white markings. In winter it is handsomest, when the colour becomes more decidedly slate-blue. The ewes are rather smaller than the rams, and their horns are much thinner and shorter, their colour paler, and the black and white bordering less distinctly defined. They usually produce two lambs in spring. Towards autumn burrell often assemble in very large flocks, but in spring and summer they are generally found in much smaller batches, sometimes only two or three together, the large rams, as a rule, herding separately. The flesh of a young male or ewe is, in autumn, as fat, tender, and better flavoured than domestic mutton. Although the favourite haunts of the burrell are open and comparatively gentle slopes of short grass just under the snow-line, these sheep are quite as sure-footed and agile as the wild-goat tribe on precipitous rocky ground, which is never very far distant from the slopes where they feed, and to this they usually resort when scared. They have the most acute sense of smell, so it is always necessary to take this into account before arranging a stalk. If burrell have sighted you, it is generally useless to follow them. They at once commence moving off, slowly and deliberately at first, feeding as they walk, leading on an inexperienced sportsman for miles, until they have fooled him sufficiently, when they gallop away, and seldom stop before they are lost to view among the eternal snows and glaciers. When disturbed the burrell gives a shrill double whistle, which alarms every other animal within sound of it; and you will seldom, if ever, get a shot after hearing it. Early in summer the best of burrell-shooting can be got on the upper ranges of the mountain provinces of Kumaon and Gurhwal, without having to cross the passes into Tibet for it.

As the ground for nāpoo in this vicinity was so limited as only to admit of one of us shooting over it, and a

few days' journey farther on there was a similar bit of country for ibex, the Major and I arranged that I should have a turn at the nāpoo, and he at the ibex, which he was more anxious to get.

Having bundled up a few requisites for a night's absence from our camp, I started upwards about noon next day, and after a long and stiff pull of several hours, reached a huge sort of corrie where my Spiti guides expected we should find our game. On our way we passed through the village of Kiwar, situated at an elevation of 13,400 feet. Although at such a high altitude, it is a fairly large, well-to-do village, and several kinds of grain are raised there (chiefly buckwheat and barley) entirely by irrigation, for the climate of Spiti is extremely dry and almost rainless. As the village lies on the south side of the mountains, it is tolerably warm.

After a careful scrutiny of the ground with the glass, I discerned a flock of about fifteen nāpoo nearly a mile off. As none of them appeared to be old rams, and we were not very far from where we intended to pass the night, I remained watching them in the hope that bigger fellows might show themselves as evening drew on. However, as no others put in an appearance, and the sun was getting low, I commenced a stalk after those in sight, with a view to supplying our empty camp-larder with good venison. We got within easy range of them rather unexpectedly, as they had fed quickly down towards us whilst hidden from view during our stalk, when the excited behaviour of my two men, on suddenly seeing the beasts so near us, was very ludicrous. Whilst one of them snatched my cap off, the other seized me under the arms and tried to lift my head over the top of some rocks, behind the cover of which we had been stealing towards the animals, he being under the impression that I could not see them. After shaking one fellow off at the risk of the burrell detecting us, and recovering my cap from the other, I was able to shoot, and

took down two right and left with the old Whitworth, much to the delight of my excited companions. After securing the beasts, and dragging them to a convenient spot for leaving them until next morning, we made the best of our way to the place we intended passing the night, under the lee of a rock. The cold was bitter lying out at night, as there was keen frost and a high wind.

We were afoot early next morning over fresh ground, and soon descried a large flock with two fine rams in it. But our attempts to approach them were fruitless, as they were in a very open position, and proved too crafty for us. Nothing more was seen except a brood of snow-pheasants which we flushed on our way down to the tents.

A few days' travelling brought us to the ibex ground, where the Major had an unsuccessful hunt, whilst I took a good rest in camp.

Any attempt of mine to describe the glacier scenery of the Spiti and Lahoul mountains, through which our way led for several days, would be quite inadequate to convey the slightest idea of its wild grandeur. Suffice it to say that the longest of Alpine glaciers, the Aletsch, which is some twenty miles in length, cannot be compared in size with many of those in the Himalayas, the largest of which are found in the Karakorum range, far to the north-west of Cashmere and Ladak.

After quitting the snow and ice on the top of the Hampta pass between the districts of Spiti and Kulu, how changed was the aspect of the mountains on its southern side, from the barren dreary solitudes amongst which we had been roaming during the past four months! With what keen delight did we hail the first glimpse of the green slopes, birch-woods, and pine-clad hills of Kulu,—a country famed for the romantic beauty of its scenery.

On reaching Sultanpore, the chief town of Kulu, we put up in a house and procured some fresh vegetables—luxuries we had not indulged in for months. A newspaper many weeks

old, that had been left there by some former occupant, was greedily pounced upon. From it I learned that my regiment was to form part of a force about to proceed on active service. There was no time to lose; so we hurried through the beautiful Kangra valley, with its numerous tea-plantations, to Dhurrumsala, the nearest military station. Here I bade good-bye to the Major, who was bound for the Punjab.

Irrespective of the ground worked over in hunting, we had covered, during this my first trip beyond the Himalayas, a good 1300 miles of regular mountain travel, about a thousand of which were in Tibet, at an elevation, on an average, of nearly 15,000 feet—almost as high as the top of Mont Blanc, though not quite so snowy. But my pleasure in looking back to these wanderings is mingled with sorrow, when I think that my boon companion throughout them has since then gone on another long journey, and this time to the “happy hunting-grounds” whence there is no returning.

CHAPTER XX.

It might naturally be supposed that, after the experiences of one visit to trans-Himalayan regions, nobody would be in a hurry to return to those cold and desolate steppes. It is not so, however, with such as are imbued with a taste for wandering among Nature's wild and wonderful works. Whatever trials and difficulties they may have undergone are soon forgotten in their ardent longing for fresh adventure or sport. Even the dangers to which the mountain-hunter is so often exposed have a sort of alluring fascination about them. I have no doubt many a Himalayan sportsman, when traversing some terribly awkward bit, where a slip might launch him into eternity, will, like myself, have inwardly declared he would never again be enticed into such a position, but only the very next day to find himself perhaps in a worse one.

Whether I am right or not in these surmises, I, at any rate, found myself ere long preparing for another trip to the wild land beyond the Himalayas. I shall not, however, ask the reader to follow our old trail there, but offer to conduct him in quite a different direction—towards Nari-Khorsum, better known as Hundés (pronounced Hoondace), the Chinese-Tibetan territory situated across the high mountain-passes of the provinces of Gurhwal and Kumaon.

On the 20th of April I set out from Dehra Doon, and as I did not expect the Niti ghat (pass), which I intended to cross into Hundés, would be practicable before the beginning

of June, there would be plenty of time for a turn over the Himalayan haunts of the burrell, to which I alluded when describing this wild sheep, known as nāpoo in Tibet, and also for a chance at the tahr.

Here I need say little about the middle Himalayan ranges through which I travelled for about a fortnight.

At one of our halting-places I found Puddoo, a Bhōtia of Niti, my shikaree and guide on a former visit to the upper ranges of Gurhwal, who had come down to meet me.

The Bhōtias of Kumaon and Gurhwal are a half-Tibetan, half-Himalayan people, inhabiting the highest villages on the upper ranges of those provinces. They are more pastoral than agricultural in their habits, and their manners and customs are more Tartar than Hindoo, although they profess to be of the latter persuasion. They occupy their villages for a few months only during the summer, migrating to the middle ranges in winter, during which they lead a nomadic life.

We crossed the river Doulee by a narrow wooden bridge below the village of Tapoobun, and ascended the opposite heights, with a view to having a day or two among the tahr. After a long and stiff climb we reached our ground towards evening, and having selected a spot for our camp, proceeded to watch some steep green slopes, to which Puddoo expected the tahr would be likely to descend, from the craggy verdureless heights above, for their evening feed. We had not long to wait before we descried a herd of tehry (female tahr) on their way down. They descended so rapidly that in the distance they looked like a lot of yellowish-brown balls hopping and rolling down over the crags, until all but two, that remained behind on the rocks, were hidden from view in an intervening grassy hollow. Presently four shaggy old bucks followed them, performing the most eccentric gambols in their descent. These were soon joined by three other old fellows coming from a different direction. At last there were none left in sight but the two tehry, which

still kept their positions like sentinels on the rocks above. We waited patiently for them to move down, until it grew so late that, at the risk of their detecting us, we commenced crawling cautiously on towards the hollow. We had almost reached a spot which commanded it, when up got a chuckor partridge in front of us. This was bad enough, but it was much worse when, a little farther on, the rest of the covey rose with a whirr! and flew right over the hollow. On carefully raising my head to reconnoitre, I could see at a glance that the tahr had taken alarm and were on the alert. One old buck stood within easy range, gazing straight towards me; but before I could cover him, he was galloping away with the rest of the herd down the hollow. I let drive at a big black fellow that was leading, and thought I had hit him, though he still continued his course. We followed up at once, and soon came on our friend as he lay, looking very sick, behind a rock. Another shot sent him off again into some precipitous ground, where we could see him standing rather groggily on a ledge; but it had now grown too dark to follow him farther that evening. Fortunately there was a bright moon to light us back to our camp, which was about two miles off, and some of the footing was not of the best.

That night I witnessed from our camp a remarkably beautiful moonlight effect. As the moon sank towards the irregular ridge of the summit of Trisool,¹ rising 22,300 feet high, away across the misty depths of the Doulee valley far below, the immense snow-fields that lay along its upper slopes glistened like broad sheets of burnished silver in the sheen of the moonbeams that played on them, causing the shadowy forms of the adjacent snow-peaks to loom all the more dim and unearthly in their pallid solemnity.

¹ So called by the natives from its irregular summit being supposed to resemble a "trisool" or trident, which is by Hindoos regarded as symbolical of their divine triad—Brahma, the creator; Vishnu, the preserver; Siva, the destroyer.

Early next morning we went to look after our wounded tahr. We found him lying dead at the foot of the precipice where he had fallen, evidently from the very ledge on which we had last seen him standing. A shaggy, black old buck he was too, with horns nearly 14 inches long.

Although I saw many more tahrny and young bucks, I had no further sport among the great old tahr during the remainder of the short time I was up here. There were, however, ample and continual sources of delight in the ever-changing views of the grand frozen peaks in the neighbourhood, as seen from these heights. One charming prospect I especially remember. As the last rays of the setting sun, shooting out from under a cloud-bank of violet, crimson, and gold, shed a ruddy glow on the snowy slopes of Trisool, and the half-naked crest (over 25,600 feet high) of Nandadevi—the wall-like shoulders of which mighty mountain are so nearly vertical as in some places to leave the pale-coloured rock quite bare of snow—the effect was truly magnificent.

Above this the Doulee valley grows much narrower, and its flanking heights more lofty and precipitous—so much so that, although up here you are in the midst of vast snowy mountains, the higher white peaks and ridges are only now and then visible from the bottom of the valley, either through lateral gaps, or when they seem to terminate the glen you are in. The river, too, now becomes more impetuous, as it leaps furiously down among huge masses of rock in a succession of roaring cataracts. Altogether the scenery here begins to assume a more savagely grand character. Soon after crossing the Reni bridge over the Rishi gunga (river)—a wild torrent fed by the snow-fields and glaciers around Nandadevi—where it flows into the Doulee, the eye is at once attracted by a remarkable cascade on the north side of the latter river. The water pours down from a tremendous height, in a narrow white stream, over a perfectly smooth and nearly perpendicular face of dark rock. It has only one break in its long descent, where it falls into a deep

receding cavity evidently hollowed out by the constant action of the water behind a ledge on the cliff; thence it leaps forth and continues its precipitate course in an unbroken line for many hundred feet. When in flood, this waterfall, which is called Bingareebeyl, has a singularly fine effect.

Our next halt was at Seraitota, so called from some "serai" (cypress) trees growing in the vicinity. We camped at the foot of a wild gorge, which, on a former visit to these parts, I had explored with Puddoo, who, well as he knew these mountains, had never previous to that time been more than a mile or two up it. As our expedition was not altogether uneventful, I shall here make a digression, and endeavour to briefly relate our experiences.

At first Puddoo had tried to dissuade me from going up this glen by telling me it was held in bad repute by the villagers, who believed it to be the haunt of an evil spirit, and that the tahr there bore charmed lives. The real truth, I suspect, was, that being my first expedition with him, he was doubtful as to what my capabilities might be at mountain work, and therefore wished to avoid the responsibility of having taken me to a place where the ground was reported to be excessively bad, in the event of any accident occurring. However, on returning to Seraitota, after hunting with him farther up the Doulee valley, he made no more objections to our visiting this "enchanted glen."

At the hamlet of Tolma, hard by, we secured the services of the "pādān" (head-man), a queer old character named Ganna, and also of two or three stout fellows to assist the lower-range coolies I had brought with me thus far, who were quite unaccustomed to carrying loads over such ground as they would have to encounter up here. For some distance we had no difficulty in getting along, up beside the torrent, until the gorge took the form of an acute-angled v, where the rocks rose so abruptly from the water that we were obliged to take a higher route along the steep hill-face. Each moment the ground became more frightful, until at

last it seemed as though further progress were next thing to impossible. Ganna now took the lead as we essayed to cross a terribly steep incline at a height of several hundred feet above the raging rock-bound torrent, where the short slippery grass that partially covered the almost vertical slope served only to make the footing more precarious. There was no way of turning this place, unless perhaps by making a very long round above. For about 150 yards there was often absolutely nothing between this world and the next but the breadth of less than half a footsole, chipped with the iron-shod point of an alpenstock out of the hard ground, in such places as there happened to be no protruding scraps of rock which might afford better footing. As Puddoo remarked, "For ourselves it was hazardous enough, but for the laden men it would be positively dangerous."

On our reaching more practicable ground we waited for the coolies to come up, as my two companions seemed to have misgivings about the lower-range men being able to proceed any farther with their loads. As we expected, when they got to the bad bit they stopped, and called out to us that they objected to crossing it. But Puddoo shouted jeeringly back, taunting them with being no mountain-men, and telling them that if they were afraid to come on they had better go home and fetch their women to help them, and suchlike banter, until they at last agreed to break up their loads and bring the things over a few at a time. I was much relieved in mind when they all arrived safely at the only possible place we could find near at hand to bivouac on—for camping was out of the question—which they never would have reached with their loads, had it not been for Puddoo's persuasive powers, and the assistance of the Tolma men who were with them. The spot we had selected was a narrow sloping shelf above the rocky linn, where, by dint of clearing off big stones and scraping away earth, we managed to get just sufficient space for sticking up my little tent, after a fashion, against the face of a high beetling crag, my

followers finding the best shelter they could in holes and crannies among the rocks.

In the afternoon, as I sat scanning the steep ground across the torrent, I could see several young bucks and some tehry on the crags. At last I detected a solitary old tahr almost hidden among some birch-bushes growing on a sloping ledge, where he was browsing on the young leaves. In the distance his shaggy coat looked quite black as I caught occasional glimpses of him through the spy-glass. After planning our stalk, I started with Puddoo and Ganna to try and circumvent him. With considerable difficulty we clambered down to the torrent, where it was spanned by a bed of hard snow, and thence climbed up through a steep wood of tall black pines until we were nearly level with the tahr. He was still browsing among the birch-bushes, at what I judged to be about 150 yards distant across a precipitous rocky gully. After recovering my wind I rested the rifle against a pine-tree, took a steady aim, and let drive. "He's hit!" exclaimed Puddoo, as the beast seemed to shoot headlong into the gully and out of sight. I was congratulating myself on having, as I thought, secured so fine a specimen, when Puddoo excitedly whispered, "Look! there he is again," as, to my great surprise, the tahr suddenly reappeared on our side of the gully. As he stopped short to listen and look about him among some fallen pine-trunks within easy range directly below us, I again took a careful shot over a prostrate tree, which offered a convenient rest. "You've surely got him this time!" said Puddoo, as the animal seemed to fall over backwards among the fallen trees. After reloading the rifle, we moved down in confident expectation of finding him lying dead; but nothing was there but the marks ploughed up by his hoofs, where he had evidently galloped headlong down-hill. We followed the track as far as we could do so without risking being benighted on our return over such awful ground, but not a drop of blood was there to be seen on it.

We had recrossed the torrent on our way back, and had reached a narrow and almost perpendicular cleft between a smooth wall of rock and a hard bank of old snow: a very awkward place, which, from being scarcely wider than a man's body, it required considerable exertion both of arms and legs to ascend. Puddoo went first, and reached the top. I followed next, and had elbowed myself half-way up, when, in endeavouring to clutch at a niche above me, I in some manner wrenched my weak shoulder, and instantly felt I had dislocated it. Calling out for assistance, I fortunately managed to support myself with the one arm and my knees until Ganna reached me from below, and Puddoo, who had divested himself of his shoes, had climbed down from above to extricate me from my unpleasant and somewhat critical position. On reaching a spot where there was space enough to lie down, with Puddoo's assistance the joint was soon replaced—for, since my first accident of a similar nature on the Pir Punchal, the experience of several repetitions of it had taught me how to act in such an emergency, and consequently I thought little of it. My companions gravely shook their heads, and I overheard them making sundry mysterious allusions to the evil reputation of the glen. A wild and eerie-looking spot this certainly was, with its frowning precipices, beetling crags, and tall black pines. As the shades of night closed down on our gloomy surroundings, the big owls began their dismal hootings from the dark echoing pine-wood across the torrent, as if deriding our futile attempt on the charmed life of that black old tahr.

During the night I was suddenly startled from a restless and rather feverish sleep—the natural consequence of my little mishap—by the sound of an avalanche of rocks and stones that came rattling down a steep gully some twenty yards from where I lay. This was followed by the occasional fall of a loose pebble on the canvas of my tent, suggesting to my disturbed imagination the idea of impend-

ing danger from above, which kept me wakeful until morning. It was therefore not surprising, taking all things into consideration, that next day my nervous system was slightly upset, and that I was quite unfit for mountain work. My cook regarding me, I suppose, in the light of an invalid, had considerably prepared a surprise for me in the shape of some delicious jelly, all duly moulded and flavoured, which he had made from tahr-meat. How he had contrived to produce such a delicacy in the little rocky hole he had selected for his kitchen, was a marvel of culinary skill. But the expedients resorted to on a pinch by your Indian Fráncatelli, and the celerity with which he can in an emergency prepare you an excellent meal, are always marvellous.

Towards dusk Puddoo, in a state of excitement which was quite unusual to his ordinarily rather phlegmatic temperament, came hurrying to tell me he had just seen what he felt sure was the tahr I had shot at the evening before, moving among the birch-bushes on the same ledge we had at first descried him. Getting out the telescope, there, sure enough, I could see a big black tahr just disappearing behind the bushes. As he did not again show himself before dark, Puddoo thought he would be unlikely to move far away during the night. That it could be our old friend, I, however, considered highly improbable—though Puddoo positively declared he could recognise in it the same uncanny beast, which had now returned to its favourite haunt to feed there on the birch-sprouts.

Next morning, as soon as it was light enough to see the opposite crags, all eyes were turned towards them—for every one of my followers, even to the cook, seemed to have become imbued with an excited sort of interest in that mysterious old tahr; but not a sign of him could we see. Except for being unable to freely use my left arm, I was now tolerably fit again. I therefore proposed visiting some ground farther up the glen, which Ganna reported as being

a pretty sure find for old bucks. We were just about to start, when it struck me that I had better take one more look through the glass towards the birch-bushes on the ledge. This time I noticed through an interstice among the branches a dark patch which I had hitherto not observed. After steadily watching it for some time I imagined I saw it move. At last all doubt was dispelled by the branches above it being shaken to and fro. Directing Puddoo's attention to it, I handed him the telescope. After a long look through it he suddenly ejaculated, "It's that —— again!" using an expressive but unmentionable term of native abuse towards the animal.

Our proposed arrangement for the day was now upset, for even if this were not the big tahr I had shot at, it was his exact counterpart; at any rate it was unlikely that a finer would be found elsewhere. This time the whole day was before us, so we resolved to try a stalk from a different direction. Owing to the precipitous nature of the ground, it would necessarily be a very much longer and more difficult business, but would, we thought, bring us much nearer our game. After about two hours' climbing, imagine our disappointment on finding that the animal's position was quite hidden below the spot which, from the other side of the glen, we had supposed would command it within easy range; and we could discover no other means of approaching it, from this side at any rate, without our being seen by the tahr. The only plan we could now devise was to send Ganna to try and steal round beyond the place from above, on the chance that, by flinging down a stone, he might frighten the animal back towards us. But the crafty beast must have decamped in some other direction than ours, for not a sign did we ever see or hear of him. If an evil genius presided over this glen, I now began myself almost to think that it must have been embodied, for the time being, in that black old buck. For not only did he seem to bear a charmed life himself, but he had effectually suc-

ceeded in inveigling us away from other animals we might have found elsewhere. How heartily did I join with my companions in anathematising the brute, as, with only one of my arms to trust to for support, I wearily scrambled back by even a more breakneck, though a much less circuitous, route than the one by which we had come out.

Soon after daybreak next morning we were making the best of a bad way up the side of the glen. We scrambled along for about a mile and a half, and then struck up a lateral gorge, where our work soon became comparatively easy and the ground more open. Here we found many fresh tracks of big tahr, and altogether the place looked a perfect sanctuary for game. We started several musk-deer, for which the nature of the ground was particularly well suited, there being many strips and patches of birch and rhododendron bushes alternating with rocky gullies. I killed one of the little animals which offered an irresistibly tempting chance—a rather unwise proceeding where there was every probability of the shot disturbing the game we were more especially in quest of. Thence we ascended a long steep gully, flanked with rhododendron-bushes and birches, in order to prospect the ground on the farther side of a high ridge, from which the gully ran down.

On reaching the crest of the ridge, the superb prospect that suddenly burst in sight was in itself a more than adequate compensation for all the difficulty and trouble undergone to obtain it. Anything more weirdly grand in the shape of a snow-scene it would have been difficult to find. There, facing us, immediately across a wide treeless abyss, stood the pale spectral form of Doonagiri "purbat" (high mountain), its gigantic proportions abruptly rising in vast cliffs and slopes of solid ice and snow until they culminated in a glistening white peak over 23,000 feet high. Although I had become habituated, I may say, to grand mountain-scenery, the effect produced on me by the startling revelation of this mighty frozen pile, and my unexpected proximity

to it, was such, that at first it inspired an almost overpowering sensation of mingled wonder and awe, until the shrinking eye gradually became more accustomed to its dazzling magnificence. What an insignificant atom of mortality I felt as I silently contemplated this stupendous immutable work of nature! If any Alpine traveller can imagine himself brought suddenly face to face with the Jungfrau, as viewed from the Wengern Alp, but considerably exaggerated, and with a towering cone of snow piled above it, he may perhaps be able to form some idea of what was before me, and of my feelings whilst I stood regarding it. As the morning wore on, huge masses of snow, detached by the sun's heat, began thundering down with a dull booming sound like salvos of distant artillery.

Several noonday hours were passed on the ridge resting and watching for game. Towards the afternoon, as we sat under the rhododendrons, where we had been sheltering from a shower of hail, we descried two tahr far up among the craggy ground across the wide hollow we had last ascended from, and almost directly above where I had killed the musk-deer. Three more soon put in an appearance still higher up, and all were fine old fellows. They took some time to make up their minds to descend towards the greener slopes lower down, my shot at the musk-deer having probably made them suspicious of danger below. Once started, however, they lost no time on their way, as they rattled down with the succession of playful skips and bounds by which these wild goats are often wont to seemingly show their glee at the prospect of their evening meal. It was very interesting to observe them through the glass, with their long shaggy hair tossing wildly about in the wind, as they reared up and butted at each other in their gambols, sometimes appearing as though they were knocked headlong, or had even fallen backwards, down from crag to crag. How little did they know they were being watched with deadly intent! At length they all settled quietly

down to feed, upon which we at once proceeded to gird up our loins for the business before us. Two men we had brought with us for carrying game were left as markers on the ridge, with directions not to leave it unless the tahr should move off before we could get within range of them. As we left the ridge I turned a parting look towards Doonagiri, where the bluish-grey shadows were now growing longer and deeper, and the declining sun was beginning to tinge the western slopes of the mighty frozen pile with a beautiful golden light.

The long narrow gully we had ascended to the ridge was unfortunately in full view of the tahr, and there was no other way of getting down, but we trusted to being able to descend it unobserved by keeping as much as possible under cover of the rhododendrons on either side. An hour's work from the ridge brought us within what we judged must be pretty close under where we had last seen the tahr from below, and as our markers had not left the ridge, we knew the animals had not moved away. But the evil genius of the glen, in the shape of ill-luck, seemed still to dog our footsteps. To our dismay a dense cloud of mist now came whirling round from below and soon hid everything above. The wind, too, which had hitherto been right, suddenly shifted and blew straight up towards the tahr. In vain was all our patient waiting until the mist cleared off, for when it temporarily did so, we saw that our markers had quitted their post, from which we knew that our game was up and gone. They afterwards told us that the tahr were all lying within 150 yards, directly above us, at the time we became enveloped in the mist.

As it was now getting late, our guide proposed that, instead of our returning by the long round below, we should take a shorter way he knew of over the mountain above. Now short-cuts are not invariably the easiest or the quickest, and more especially when they have to be made through the clouds. It was all very well for Ganna

with his habitually naked feet and toes as prehensile as a monkey's, and for Puddoo, who could without inconvenience go barefooted when he chose; but, for myself with my boots, had I known what I was being let in for, I think that, considering all things, my weak shoulder included, I should have chosen the longer route. We continued our steep ascent until we reached what appeared, through the clouds that enveloped our more distant surroundings, to be a ridge of huge rugged rocks, from whence a dark narrow chasm descended abruptly into infinite misty space below. Black wall-like crags rose on both sides of a narrow strip of hard snow, shooting downward at an angle of something less than 45 degrees. Down this gloomy forbidding-looking abyss our way now led. We commenced the descent by lowering ourselves over an almost perpendicular face of rock for some twenty feet on to the sloping slippery snow-bed, down which we went slowly and carefully, having often to notch the hard snow for foothold. Thus we proceeded over alternate snow and bare rock, with the same clouded emptiness still below us, until we must have descended at least 1000 feet, when the monotony of our precarious and seemingly endless undertaking was varied by a musk-deer starting up close to us. As he stood to look back within twenty-five paces, his dim shadowy form looming large and spectre-like through the mist, I got hold of the rifle from Puddoo, who was carrying it, and rolled him over; but as he contrived to struggle away for a short distance down the rocks, we had some trouble in securing him. This caused considerable delay; consequently, by the time Ganna had shouldered him, the already waning light had almost failed us. Down and still down we scrambled through the murky mist, until at length it grew so dark as to make it next thing to impossible to move a step without danger of missing our footing. Matters were now getting rather serious, for our guide,

in reply to my repeated and anxious inquiries as to how far we had yet to descend, had rather unwillingly informed me that there was still some "mooskhil" (difficulty) below us. Moreover, I had casually discovered that we were in the very gully down which the avalanche of rocks and stones had fallen two nights before. I was just beginning to realise the disagreeable probability of our having to pass a cold gruesome night in an upright position on some narrow ledge of rock, when, to my infinite relief of mind, I heard voices below, which were joyously replied to, and ere long the welcome glimmer of a light appeared dimly struggling up through the fog. Our two markers, who were Tolma men, after picking up the musk-deer I had killed in the morning, had returned to our bivouac by the lower route. Well knowing the difficulties of the upper one, which they thought it probable Ganna, to save time, would take, they had, on its growing dark, started up the gully to meet us, accompanied by my Goorkha servant carrying a lantern. Another half-hour of very ticklish work took us down to the tent, after a direct descent of several thousand feet, a great part of which might, under the circumstances, have fairly been termed rather perilous.

My time being then limited, I was reluctantly obliged next day to quit this excellent though to me unlucky bit of tahr-ground, by the same difficult way we had got at it. But let us now resume our present trip, and in another chapter try a turn at the burrell for a change.

CHAPTER XXI.

BELOW the northern slopes of Doonagiri purbat, in the middle of an immense kind of corrie several miles broad, lies a Bhōtia hamlet bearing the same name as the mountain, at an elevation of nearly 12,000 feet. The broken grassy slopes about the foot of a big glacier which runs down the east side of the purbat and discharges itself

A "Sanga," or wooden bridge.

into this huge natural amphitheatre, are, early in the season, a favourite resort of burrell, before the villagers take their flocks up there for the summer pasturage. Thither, therefore, I now resolved to direct my steps.

Crossing the Doulee by a rude wooden bridge, we pro-

ceeded for several miles along its opposite bank, where the rocks sometimes rose so directly from the river as to necessitate their being passed on rough loose planks or poles supported on stakes driven into crevices below them. Recrossing the Doulee next morning by another very rustic, and in this instance rather rickety bridge, we struck up a narrow and deep glen, as romantic and wild as forest and crag could make it, passing the picturesquely-built little wooden *châlet* of Rwing about a mile from its foot. After ascending 4000 odd feet from the river, in a distance of only five or six miles, we reached the aforementioned wide and elevated mountain-basin, and camped close beside the hamlet, to which the Bhōtia inhabitants had only just returned from their winter sojourn below. The village *pādān* was most attentive and obliging, and willing to give us all the assistance and information we required regarding game. Up here we were almost above the limit of forest, except for a few birch-trees and rhododendron-bushes, which latter were all abloom with pure white and pale lilac blossoms.

As we left the hamlet next morning and took our way up towards the glacier, the snowy heights above were just being tipped with a pale rosy reflection, though the dawning light was still dim and grey below. The crisp frosty air was pinching cold, but an hour's sharp walking warmed us up. On reaching the foot of the glacier, we stopped to take a careful survey of the neighbouring slopes. There were three small flocks of burrell visible, but the spy-glass showed that they contained no old rams; so we let them be, and went on upward along the lateral moraine of the glacier in search of something better. Nothing more, however, being discovered, I got on to the glacier and proceeded up over it, more from curiosity regarding it than with any idea of finding game farther up. The ice was grey and very dirty, with few crevasses, and the surface, though lumpy, irregular, and thickly strewn with large stones, was quite easy to traverse.

People in India have not yet taken to attempting ascents of the highest mountains. Of late years the few members of the Alpine Club who have come to the Himalayas for that purpose, have found the native shikarees and guides, who are unequalled as cragsmen, to be quite useless as ice-men. The fact is, they seldom have any occasion to cross glaciers. Very few of the passes usually traversed lead over them, and in the pursuit of game glaciers are avoided, as no game is found near their higher regions. Another reason why these "paharees" are so helpless on ice is, that they are so badly shod. Boots are unknown among them, and many of them only wear shoes on festive occasions. Moreover, every high snow-peak is regarded by these mountaineers, who are mostly Hindoos, with superstitious awe, as the abode of one or other of their deities, whom they fear to offend. Himalayan guides will doubtless improve at ice work ere long, if their services are in demand for that purpose. The Cashmere mountaineers, who are chiefly Mahomedans, and who have their lower extremities protected by sandals and bandages, are much more at home on steep snow-slopes and ice.

After going up one of the Doonagiri glaciers—for there are two which unite—a considerable distance, I got such a racking headache, probably from the combined effects of the intense heat of the sun on the glacier and the cutting wind that came sweeping over it, that I was forced to return. The evening was spent watching, with the spy-glass, the movements of two or three small lots of burrell that were feeding on a rugged, partially grass-clad slope away across a deep and wide treeless hollow, down which ran the broken torrent that drained the glacier. As there were several good-looking heads in one of the flocks, I resolved to be after them on the morrow.

Not caring to ford the deep rapid snow-stream the first thing in the morning, we took a longer way to cross it dry-footed, up over the bottom of the glacier; consequently we

were a considerable time reaching our ground, close as it appeared in a direct line. At the early hour we had set out, it was too dark to take a look with the glass across the hollow, but on nearing the place where, the evening before, I had last seen the burrell, we descried a flock with rams in it away down below. Whilst attempting to approach these, another lot we had not noticed above, and which evidently contained the bigger-horned fellows we wanted to find, got intelligence of us and betook themselves far up the slope, until they apparently thought they were well out of danger, as after a time they all lay down. A misty drizzling shower of rain now began to fall, which, as the footing was easy and the ground somewhat open, rather favoured our movements than otherwise ; consequently we had little difficulty in reaching a spot within eighty yards or so of where we had seen the animals lie down. On reconnoitring them from behind a rock, I saw they had risen and were slowly moving off, as if they had just got wind of us. There was no time to lose, so I let the biggest fellow have it, when down he went, rolling over and over among the rocks. The rest sped on, but as the ground they had to get over was rough and steep, I was able to get a chance at another ram before they all disappeared in succession round a sort of ledge overhanging a deep drop.

As we could see that the first ram was safely disposed of, we followed up as quickly as possible in order to mark the flock, for both Puddoo and I thought the second shot had also told. We had got round the ledge and were making our way over the crags beyond it, when Puddoo, who was tracking ahead, stopped short, and gazing downward, remarked, "There's no need to go farther, for look there!" The steep rocks below were smeared with blood, from which, and other unmistakable signs, it was evident that the wounded ram had toppled over and slid down them, though, from the drop beneath being so abrupt, we were unable to see how far he had gone. We now turned back

and got down to where the first ram had fallen. He was a good beast, with thick horns about two feet long. After cutting off his head and cleaning him, we hid his carcass with stones from the soaring carrion-feeders, and then proceeded round below to look for the other animal. We found him lying quite dead, and considerably smashed by his tremendous fall among the rocks. Luckily his head, which was nearly as good as that of the first I had shot, was little injured. Well satisfied with our forenoon's sport, we made straight for camp, which, by fording the stream, we reached in a much shorter time than we had taken in coming out.

It was now the end of May, and as the Niti ghat was several days' journey from here, I concluded it would be practicable for crossing by the time we got there. We therefore struck our camp next day. Six buxom Bhōtia lasses assisted in carrying our traps down as far as Rwing, where we camped that evening. At first they were timid and shy, but soon became more confident and communicative as they trudged merrily along with their loads, laughing and joking as they went. From here we easily reached the village of Malāri in a day. The wild beauty of the Doulee valley below Malāri is much added to by grand deodar cedars and cypress-trees (*Cupressus torulosa*), which are scattered over the lofty overhanging crags. You see great old trees, some of them many feet in diameter,¹ clinging by their gnarled roots to narrow ledges or clefts on the faces of almost vertical precipices, and you wonder how on earth they can stand and flourish there as they do, with nothing apparently but the naked rock to sustain them. On the opposite (north) side of the river, situated at the entrance of a narrow gap, through the vista of which you can see a fine glacier rising white and broken, the village of Kosa

¹ These two beautiful trees, which are the pride and ornament of the Himalayas, grow to a height of considerably over 200 feet, and in girth are frequently met with 38 to 40 feet, at 4 or 5 feet from the ground. The timber of both is excellent.

stands perched among the rocks, having, with its projecting eaves and weather-stained timbers, all the picturesque look of a Swiss *châlet*. Up this gorge towards the glacier is good ground for tahr. In fact all the lateral gorges of the Doulee valley are, in their upper regions, the resorts of either tahr or burrell; but in some of them the difficult nature of the ground is such that I do not think I overrate it when I affirm that unless one is tolerably free from the feeling of apprehension commonly termed "giddiness," hunting there is always more or less attended with risk. Indeed a great many of the native mountaineers themselves lose their lives in the pursuit of tahr.

The village of Malāri, consisting of about eighty houses, is situated, almost overhanging the river, in an open kind of basin, where the tolerably level ground is, in the summer months, taken every advantage of by the inhabitants for the cultivation of buckwheat (here called "phaper") and barley. The Bhōtias having just reoccupied the place for the summer months, it presented a much more cheerful aspect than it did on a former visit I had made to it earlier in the spring, when it was all silent and deserted, with the wooden roofs here and there torn up, where the bears had during the winter effected a burglarious entrance after the stores of grain. I found the burrell at that time low down on the slopes in the immediate neighbourhood, and shot a ram there. The track upward to Niti had, in many places where it almost overhangs the river, been carried clean away by avalanches, or was blocked by huge pine-trees, rocks, and *débris* lying over it, that had been swept down by them. In short, all above this was at that season solitude and desolation. Now the road had been cleared and repaired by the Bhōtias, with parties of whom, male and female, moving up with their goods and herds by easy stages to the higher villages, we found it thronged. The men wore long, light, drab-coloured woollen tunics, and continuations of the same material. The women were more

gaily attired in coloured skirts and bodices, with a brown blanket tastefully and ingeniously wrapped about their upper persons so as to leave the arms free. A white cotton cloth was thrown over the head, drawn tight above the brows, fastened back behind the ears, and allowed to hang loosely down the back. Most of them sported jewellery in the shape of ear-rings, nose-rings, and necklaces. The men were stout and sturdy, and some of the young girls, with their olive complexions and ruddy cheeks, were pleasing and bright-looking, if not actually pretty.

After passing the Bhōtia hamlets of Bumpa and Gumsali, the path enters a narrow gorge, where the scenery for about a mile is magnificently wild. The raging river is flanked on each side by bare black cliffs and crags rising from the water to a stupendous height.

Beyond the gorge the valley widens into an open space, where on a sloping spur lies the village of Niti, the highest in the valley, at an elevation of nearly 12,000 feet. A mile or so before reaching the village, a track branches off to the right, leading over the Chor Hōti pass. Although a shorter route into Hundés, it is considerably higher than that over the Niti pass, and therefore not practicable as early in summer. The heights above the village, where not too steep for anything to grow on, are thickly clad with a kind of gorse, which, when covered with its pale-golden bloom, gives them quite a gorgeous appearance. A curious thing that attracted my attention here was an extraordinary collection of old cast-off shoes that were strewn over a flat space immediately below the village. There must have been several hundred, all looking black and shrivelled up from having probably lain buried there under the snows of many a winter.

Here I learnt that the pass had been declared open by the Tibetan vakeel (envoy), who, with his small retinue, had arrived at Niti village after crossing it. The Niti pass, which is only 16,600 feet, is often practicable earlier than

this, but then at the risk of falling avalanches and other dangers, and only for pedestrians, the snow being too deep, and on steep slopes too unstable, for baggage-animals to travel over. The Hoonyas,¹ moreover, object to its being crossed even by the Bhōtias, before sending their vakeel over to Niti to arrange matters of business with them respecting the pass, which here separates the British and Tibetan dominions. The "boss" of the party, a fine-looking Tartar, paid me a visit at my tent. As he was to leave Niti on his return homewards next day, I sent a polite message by him to the "Jongpen," or governor of the district beyond the pass, requesting his permission to hunt there. But few of the Bhōtias having as yet returned to the village, I was delayed here a day or two whilst "joo-boos"² for carriage, and supplies for our sojourn in Hundés, where nothing of the kind could be procured, were being fetched from the Bhōtia encampments lower down.

All arrangements being completed, I started on 6th June with fifteen laden joo-boos, and eight Bhōtias to look after them. This may seem rather heavy marching-order for a sportsman's requirements; but having to carry with us an extra tent for the Bhōtia followers, a month's food for about a dozen people, and the baggage-animals having, moreover, to be lightly laden for getting over the snow-beds, which would still be lying deep along portions of our route, will account for it. The summit of the pass is about 25 miles from Niti village, beyond which the mountains, except for a few birch-trees, become bare and desolate. The first day we proceeded up the valley of the Doulee—here called the Niti—to a spot called Goting. Soon after leaving the village the way leads for some eight miles, in a succession of tire-some ups and downs where it crosses deep precipitous gullies, along a bare stony hill-face with so sharp a slope

¹ The Tibetan inhabitants of Hundés are called Hoonyas.

² The "joo-boo" is a cross between the yak and the ordinary horned cattle of the Himalayas.

that you cannot see the river, although you can hear it roaring sullenly down its narrow rocky channel some 2000 feet, on an average, below. The track, which had not as yet been repaired by the Bhōtias, was narrow and broken, and in many parts had been carried clear away by slips of earth and snow, and broad beds of snow still lay hard, smooth, and terribly steep in some of the gullies we crossed. In such places we had ourselves to make it passable for the jooboos, with tools we carried with us for the purpose. As we went along we could sometimes see the summer avalanches — which are quite different from the more destructive ones of the early spring—coming tumbling down the rocky gullies on the steep mountain-face across the river; the streams of falling snow appearing in the distance to descend quite slowly, though they were really thundering down at a fearful rate. At one point we reached an elevation of nearly 15,000 feet, just before descending to Goting, which is about 13,000 feet. These altitudes I ascertained by my mountain aneroid, which I had had corrected at the headquarters of the great Trigonometrical Survey of India, at Dehra Doon, before starting. Few aneroids, however, if any, are to be much depended on above 15,000 feet at most. Up to that height I found mine wonderfully accurate at altitudes marked on the Survey maps. Above this it played all kinds of jinks, making the summit of the Niti pass, for instance, which is well under 17,000 feet, to be over 20,000 feet; but on again descending below 15,000 feet it resumed its normal good behaviour.

The camping-place of Goting is a small flat of green turf, almost surrounded with abrupt scarps of earth overhanging the river. A solitary clump of birch-trees growing on a slope hard by afforded a plentiful supply of fuel for our camp-fire. Some of these gaunt old specimens, with their gnarled and crooked limbs, must have weathered the storms of centuries. One or two grey old giants I measured in

this neighbourhood were nearly 15 feet in girth. These were the last trees we saw beyond Niti. Before the snow melts off the neighbouring heights, the slopes about Goting are good for several days' burrell-shooting, and there, on a former visit, I got the biggest horned ram of the kind I ever killed. As he afforded me a capital day's sport, I shall here devote a page or two to his memory.

As I had no intention of crossing the pass that season, I reached Niti much earlier in the year. The village then looked tristful and forlorn in its emptiness. The snow still lay in broad patches on the heights close above it, and the burrell were all low down. As we left the village for Goting in the grey of early morning, the only living sound that broke the still frosty air was the wild whistling call of the "heonwal" (snow-pheasants), as they sat on bare knolls among the gorse-bushes, their long-drawn mournful notes according well with the lonesome scene around. They did not seem very shy, but as they were generally in pairs I refrained from going after them. The track to Goting was often, for long distances, quite buried in snow. In some places where it had just melted off, and the hard steep ground was glazed over with a slippery coating of ice, which had at times to be chipped for foothold, a glance down towards the hidden depth far below sent a cold creepy thrill through the nerves that was anything but pleasant.

A few miles below Goting we descried across the valley a flock of twelve burrell, and with the glass I could distinguish two grand old rams in it. They were on a small sloping patch of green grass above the precipitous rocks rising directly from the river, having evidently descended to feed there from the heights above, the upper regions of which were covered with snow, and the steep declivities below, where it had only recently melted off, were, for a long way down, still quite destitute of verdure. There was no means of crossing the river nearer than Goting, where

Puddoo said we should find a natural bridge of snow. It was too late, however, when we reached there to go after the burrell that day; but as nothing was likely to disturb them, and there was then no food for them above, we should have every chance of finding them still on or near the same ground in the morning. As we were pitching the camp, one of the men who had gone to fetch water came and told me he had seen some burrell feeding farther down our side of the river; so Puddoo and I at once started to look after them. There was one good ram in the flock, which was a small one; but our attempt at a stalk was a failure, as the wary creatures got wind of us and made off.

Early next morning we clambered down the steep scarp of frost-rotted earth to the natural bridge which was formed of hard old snow jammed up between huge fragments of rock that had fallen from above, almost across the river, where it rushed through a narrow chasm. It was an awkward place to cross, and after getting over, there was an abominably steep bit to be surmounted, where the ground was smooth and friable, before we could proceed down the valley, along the rocks that overhung the river raging along its narrow bed. Thence we got on pretty easily for a mile or two, keeping a sharp look-out upward before crossing each steep gully we came to, lest an avalanche of snow, or loose rocks and stones, which at any moment might be expected, should come down upon us. At last we neared the place where, from the opposite side, we had seen the flock of burrell. We had just rounded a corner, when a lot of ewes, which started up from a ravine just beyond it, went scampering away, and almost immediately after we saw the flock containing the two big rams also moving quickly upward from the very place where we had at first sighted it, having evidently taken alarm at the flight of the ewes. This was very annoying; but as the second flock had not actually seen us, there was still a chance of getting a crack at the rams before evening.

Up and still up the beasts continued slowly to ascend, until, after watching them for an hour or more, we finally lost sight of them among the snow-fields above. As they would be pretty sure to descend again in the evening to their feeding-ground, we moved upward for some distance towards a commanding spot from whence we could more easily watch their movements. We were skirting a small coppice of birch and rhododendron bushes, when a fine little buck musk-deer jumped up close to us. As he stopped to look back I sent a bullet through him, but had to follow up and give him a second shot before securing him. After relieving him of his musk-bag (which ought always to be done at once), and hiding him from the birds of prey, we continued our ascent to the spot where we intended to wait for the burrell.

Here I discussed my breakfast, and then commenced a careful search with the telescope for our friends above. At length I made them out, reposing on some bare rocks among the snow-fields; and with the glass I could discern the arching horns of one of the big fellows, standing out in relief against a snow-bed, as he lay on a slab of stone below it. For hours we waited there, every now and then taking a look through the spy-glass at the burrell, lest we should lose sight of them if they moved, until, as the afternoon wore on, they rose. At first they came downward very slowly; but hunger, I suppose, soon made them quicken their movements, till they got below the snow-fields, when they stopped from time to time to nibble the dry withered leaves of the dwarf rhododendron plants,¹ the only vegetation apparently up there. After making pretty sure of their intentions, we commenced a stalk up to meet them, for it was now drawing towards evening, and we

¹ The bloom of these little shrubs is here a pale yellow; in other respects they are exactly similar to the Alpen rosen. I was told that the red-flowered kind also grows here, though I never saw it myself.

"AS HE STOOD THERE MOTIONLESS AS A STATUE."

were a considerable distance from our camp. It was a long and steep climb, and all the more difficult from our having sometimes to scramble round, over awkward bits, in order to keep out of view of the animals.

At length we reached a point where some big rocks projected over the side of a wide gully, into which we knew the burrell must have descended, though they were now hidden from our sight. Puddoo, who had climbed on to the rocks to reconnoitre, at once beckoned me to come up beside him. On slowly raising my head to look over, I beheld, within 150 yards, and almost on a level with us, a big ram standing on an isolated crag above a deep drop. What a beauty he looked as he stood there motionless as a statue, gazing intently downward! But I had little time for admiring him, as his companions were moving on. Owing to the ram's position, and the shape of the rocks we were on, it so happened that shooting from the right shoulder was difficult. I, however, managed to screw myself round into an awkward attitude, and taking as steady an aim as, under such circumstances, I was able, fired my shot. The ram tottered for a second, and then fell headlong down some 150 feet. The rest of the flock at once huddled together and commenced retracing their steps slowly upwards, but after going a short distance they stood again with all their heads turned towards us. Singling out the other big fellow, I sent the contents of the second barrel at him, and saw him, as I imagined, go tumbling down after his companion. "Quick!" whispered Puddoo, "now take the other big one," as he handed me my spare rifle. To my surprise, I now saw the big fellow I had just shot at continuing his ascent with the rest of the flock. But, alas! I had missed my chance, as the other rifle was only a little .360 bore, for an accurate shot with which the ram was now too far out. The second bullet had gone just over the big fellow's shoulder, and had brought down a ewe that had

been standing immediately above and behind him. Had it struck an inch or two lower, it would in all probability have killed them both.

It was disappointing to have thus killed the wrong animal by mistake, but on getting down to the beasts I had shot, it was consoling to find that the ram had perfect horns, 27 inches long. As it was now getting late, there was no time to gralloch them, so we merely cut slits in their paunches to let out the foul gas, and taking off the big fellow's head, made the best of our way back to camp, which we reached just before dark.

Next day the men sent to fetch the dead burrell found an "ounce," or, as it is more commonly called, a snow-leopard, at work on them. If the stupids had only had sense enough to leave one of the carcasses as a bait, the beast would certainly have returned to it, and in all probability I should have got a shot at a rather rare animal I was most anxious to kill. During that visit to Goting I had two more days on other good beats; but as I have said quite enough about burrell-hunting for the present, we will now resume our journey towards Hundés.

A few miles above Goting the valley suddenly contracts into a deep and narrow defile. Just before entering it, I shot a ram out of a flock of burrell that unexpectedly showed themselves above some high rocks overhanging the track. The animals had evidently come down to a salt-lick there is here close by the wayside. The beast I had killed had most conveniently fallen down on to the track, where we left him for the men following with the jooboos to pick up. Throughout the defile, which is several miles long, the river was then covered over with a hard bed of snow, which made our progress there much easier than on our return, after the snow-bed had disappeared, when the baggage-animals had to scramble along the rocky steeps rising abruptly from the river. We had some trouble, however, in circumventing one or two awkward places where the snow had already fallen

in and left yawning holes disclosing the dark gurgling water tearing along below. We stopped for that day at the head of the defile, where the stony ground was clear of snow, and the cold blast that blew down the gorge as if through a funnel raised the dust in clouds and made it difficult to keep our tents standing. Beyond this, for the ten or twelve miles before reaching the summit of the pass, there is no difficulty to speak of, and the scenery is grand though somewhat dreary and monotonous. Across the river, on the south side, several flocks of burrell containing some good rams were seen on the steep slopes. We camped just below the short but pretty stiff final ascent to the top of the ghat, in order to get over it in the early morning before the snow became softened by the heat of the sun.

Starting very early, the crest was reached soon after sunrise. The view you get from it of Hundés is more striking than beautiful. In the glaring picture before you there is an absence of what a painter would call *chiaro-oscuro*; not in its literal sense by any means, for there is certainly no want of light and shade, but in the harmonious blending of these effects, which is, I think, the technical acceptation of the term. The aerial perspective, too, looks almost unnatural in its clearness. That mighty object of Hindoo veneration, the Kailás peak, rising 22,000 odd feet, about a hundred miles away eastward, close above the great holy lake of Mansorawar—which latter, though invisible from the pass, I knew to be quite that distance as the crow flies—did not seem more than half as far off. In vain do you here look for the beautiful sunrise or sunset effects of more dense and humid atmospheres, for the sun shines through the thin air of these high Tibetan regions with the same garish-white glare when on the horizon as when on the meridian. Perhaps I might have viewed the prospect before me in a different light under more agreeable circumstances, but the high wind that blew the dry drifting snow off the neighbouring mountain-tops in long pennon-like

clouds chilled one to the very marrow, and I had a dreadful headache to boot.

The watershed here deserves notice. Speaking figuratively, if, when standing beside the cairn on the pass, you throw a snowball towards the west, it melts into a tributary of the Ganges, and so into the Bay of Bengal. If you fling another towards the east, it will melt into the Sutlej—here flowing almost northward beyond the pass—be carried back by that river westward through the Himalayan chain, and so find its way eventually down the Indus into the Arabian Sea.

After getting half-frozen whilst attempting to make a hurried sketch, with my fingers so benumbed that I could scarcely hold the pencil, it was almost a relief to be plodding on again knee-deep through the snow, down towards where we camped for the night, four or five miles farther on, after a descent, for the most part over deep snow, of some 2000 feet.

The cold here at night was terrible. All the wraps I possessed failed to keep out the piercing wind, so we waited until the rising sun warmed us up before we set out next day. We only went four or five miles, chiefly along the stony bed of the Sakchu—a stream of snow-water, which had to be forded several times—to a spot where there was some grazing for the poor jooboos, which had been fasting for two days. Here we were interviewed by a deputation of Hoonyas, sent by the Jongpen from his residence at Dāpā, about twenty miles off, to arrange about the period he was to permit us to remain in Tibetan territory. At first these emissaries would hear of nothing more than eight days; but after a good deal of persuasion from Puddoo, and their hearts had been softened by a bottle of whisky, they eventually agreed to fifteen, beyond which they said it was impossible to extend the permission without the sanction of the Jongpen. To this functionary I therefore sent by them a present of a revolver, accompanied by a request that, as I

had come so far to hunt there, he would do me the favour to extend the privilege to a month. Before taking their departure, however, they asked me to sign an agreement to the effect that I would not attempt to cross the river Sotlej, and that I should return over the pass by the appointed time, pending a reference to the Jongpen. They also left two queer-looking old fellows of their number behind them, to see that we did not trespass beyond the prescribed limits. They were quite open to a little trade, and sold me a large thick woollen rug called a "chookta," which, after drowning its inhabitants by soaking it for several hours in the stream, made a most comfortable and requisite addition to my wraps at night.

A sudden snowstorm delayed our departure until rather late next morning, when we started in the direction of a good locality for *Oves Ammon*, known as Tāzāng, with our escort of Hoonya cavalry, mounted on yaks as their chargers, following at some distance behind us.

CHAPTER XXII.

WE were now well out on the undulating uplands of Hundés, and traversing ground where we might expect to find the big wild sheep. A strange weird-looking land, to all appearance a desert, stretching far and wide before us towards distant ranges of barren undulating mountains, tinted with every shade of red, yellow, purple, and blue, rising tier beyond tier, and culminating in snow-clad ridges and peaks—all their features looking marvellously distinct through the clear rare atmosphere. Broad table-lands, averaging about 15,000 feet above the sea-level, bare, brown, and monotonous, sloping gradually down from the foot of the great snowy chain of the Himalayas behind us, and intersected by huge ravines, growing deeper and wider as they all trend northwards towards the river Sutlej, here called the Satroodra, flowing (from east to west), hidden among their mighty labyrinths, far away below us. The solemn waste here and there diversified by low arid hills of a brick-red hue. In the dark sapphire-blue firmament, a blazing sun shedding a cheerless dazzling glare on all around us. Not a sound but the wailing of the wind to break the dead depressing silence, save perhaps the hoarse croak of a solitary big raven, or the snorting of a troop of kiang, as the startled animals stand for a few seconds to gaze inquiringly at the intruders on their wild domain, ere they wheel simultaneously about and gallop madly away over the rolling wind-swept slopes of shingle and sun-baked earth, leaving a drifting cloud of dust to mark their track.

Here, in small flocks, few and far between, roams the ponderous-horned *Ovis*, ever watchful and wary, suspecting danger in each gust of the icy blast that comes fitfully sweeping over this bleak howling wilderness. A wolf may occasionally be detected slinking stealthily off. Sometimes a shy hare starts from the cover of a scrubby tussock of the stunted herbage that is sparsely scattered over the stony soil; or a grey marmot may be seen sitting erect on some sandy knoll, disturbing nature's silent repose with its shrill chirping whistle ere it vanishes into its burrow hard by. Even the Tartar hamlets, which very rarely occur in these dreary inhospitable wilds, have a dilapidated, decayed, and forlorn look about them that is quite in keeping with their desolate dream-like surroundings. Such were my general impressions of the country we were now in.

As we were trudging along some distance ahead of the jooboos, a small flock of ewe *Oves Ammon* was descried in the distance. Kiangs were feeding here and there among the few bunchy tufts of herbage on the stony plain. We also saw a fine reddish-coloured fox. Our camp was pitched in the best shelter from the wind we could find in a ravine, where some strips of greensward along the banks of a small stream afforded food for the jooboos, but there was no fuel except the thick roots of the "debsing" grass. The boortze of more northern Tibetan regions is here called "debsing."

Here we decided to remain for a day or two, to hunt in the vicinity. We found one flock of five splendid old rams, and made several attempts to get at them; but the ground they were on was so flat and bare, and the beasts were so wary, that it was impossible to get within measurable distance of them: we might just as well have tried to stalk the moon. The innumerable kiangs, too, here grazing about in every direction, were a great nuisance, their startled movements being always calculated to put the *Oves* on the alert. For even when you may think you are quite safe from detection by an *Ovis Ammon* as

regards sight and scent, no animal has a keener perception of danger from any suspicious sign or movement on the part of other living beings within range of his vision, however far distant from him they may be.

Whilst camped here the messengers from Dāpā again turned up, bringing with them a present from the Jongpen of some yaks' tails, and an answer to the effect that twenty-one days was the utmost time he could possibly allow me, owing, he said, to pressure put on him in such matters from Lhasa. So the contract was signed, sealed, and delivered, and I was of course in honour bound to abide by it. This limited period precluded any chance I might have had of getting a shot at the wild yaks (here called "bunchowr"), which, though very numerous on the other (north) side of the Sutlej, are only sometimes to be met with on this side, and generally so far eastward from here that I should not have time to reach their haunts.¹ I might have adopted the arbitrary plan of refusing to sign any agreement, but the passive resistance to all my further proceedings in the country which might probably have been the only consequence of my doing so, would have been quite as detrimental to my chances of sport there as a more active and forcible one. I therefore determined to make the best use of the time allowed.

Next morning the cattle were packed and sent off to a spot where there was feeding for them a few miles from here, in the direction of the Sutlej, whilst Puddoo and I made a circuit over the table-land and through the ravines more eastward. We made out a flock of *Oves* miles away, up towards the Himalayan slopes; but as, even with the aid of the spy-glass, we were doubtful whether they were ewes or young males with small horns, and they were

¹ Tibetan antelopes—here called "tso"—and "goa," Tibetan gazelles, are also to be found in Hundés, but only, I believe, well northward of the Sutlej, or farther eastward beyond the Mansorawar lake.

also in a direction opposite to the one we wished to take, we paid them no further attention. Towards the afternoon we found two burrell rams, which we stalked without much difficulty, and one of them was killed. I noticed on this occasion, and many others, on these high undulating uplands, that a shot had a peculiarly dull and flat sound, which was probably due to atmospheric influence. There was none of the usual ring or reverberation in the thin air of this high region. Nor was there an echo to the report of a gun even under conditions of ground where it might ordinarily have been expected. Had it not been for the usual recoil, I might have supposed that the rifle was loaded with an insufficient charge of powder. On our way back we came across a Hoonya encampment, the occupants of which were busily engaged sheep-shearing. They were using a knife in place of shears for removing the fleeces, which I noticed were very fine and long.

Herds, consisting sometimes of thousands of sheep, goats, and yaks, may be seen about a Hoonya camp, all of them as wild as deer, and it is interesting to observe the way in which they are tended. The sheep and goats are picketed at night in troops, exactly like the horses of a cavalry regiment. Two long ropes are stretched along the ground and made fast about a yard apart, with nooses on each rope about two feet apart. In the evening the sheep and goats are collected, and surrounded by the men, women, and children in a circle, who all continue singing, which appears to have the effect of quieting the animals. This circle is gradually contracted around the ropes, and in a marvellously short space of time all the animals' heads are tied in these nooses, heads inwards, facing each other. The women then go round with pails, singing all the time, and milk them. Eight or ten women follow each other, each operating on every sheep and goat, but not spending more than a quarter of a minute over each. Sheep and

goats are tied up indiscriminately, and the milk is of course mixed.

From here we next day took a beat northward, over the same description of ground, and soon discovered two good *Oves Ammon* rams. Although they were not much more than half a mile from us, we had to make a round of what appeared to me several miles, to try and approach them—and all on account of there being only some fifty yards of the intervening ground to cross exposed to their watchful eyes, which difficulty it was impossible otherwise to circumvent. And after all our trouble, the animals seemed to have spirited themselves away, for not a trace of them could we find on the hard gravelly ground to indicate what direction they had taken. It was now noon, and we had brought no food with us, having that morning intended to return early to camp; but the two rams had upset this arrangement, so we sent back our spare man to fetch something to eat, and continued our search for them. We had not gone far when we espied a solitary ram, carrying fairly good horns. After moving restlessly about for some time, he lay down on an exposed eminence, where there was no possible way of approaching him nearer than about 400 yards. We therefore lay down and waited, in the hope that he might move on to more suitable ground for a stalk. He seemed to be suffering from an attack of bronchitis, for, as I watched him through the glass, I distinctly saw that he was constantly coughing. After we had lain there about two hours, exposed to the hard wind and baking sun, waiting for the beast to rise, hunger began to assert itself, which caused us to grow impatient. We therefore decided to try and shorten the intervening distance by creeping towards him in the open, under the delusion that his seeming indisposition would perhaps make him reluctant to bestir himself. Strange to say, he allowed us to get well within 300 yards before he rose, which unusual

negligence on the part of an *Ovis Ammon* we could only attribute to his ailment. He moved off very slowly, so I hastened his departure with a bullet; and as on examining the place where I had shot at him we found a good-sized tuft of his hair on the ground, I must have shaved him pretty closely. We now made for the spot where Puddoo had arranged for the provender to be brought to, and after appeasing our hunger, proceeded to try fresh ground. No game was found on it, however, which was not surprising, as we detected poachers there in the shape of two grey wolves (here called "chanko"), one of which I sent limping away with a broken hind-leg. By the time we got back to camp in the evening, I felt as if I had done perhaps a little more than enough work since early morning.

Our camp was moved next day to Dongpu, the first inhabited place we had met with since leaving the village of Niti. A Tartar hamlet and small gompa (monastery)—the latter coloured red—perched along the crest of a pale-yellowish low ridge, of which the crumbling half-dilapidated houses seemed to form a part. A rapid turbid stream of melted snow (the Sakchu) wound along below it, and some terraced fields in the vicinity looked so arid and stony that it was difficult to conceive how anything could ever grow there. The village looked utterly dreary and forsaken,—a few decrepit old men and wizened hags being its sole inhabitants, the rest being absent in their camps, grazing their flocks in the wilderness around. Altogether, the place and its surroundings looked so dreamy and unreal in the quivering reflected heat and dazzling white glare of noon, that it seemed almost as though it belonged to some other and less beautiful world.

From here we worked over ground where Puddoo had made certain of finding *Oves Ammon*, but unfortunately we found it occupied by flocks of *Oves Tartar* and goats instead.

Out on a big plateau we saw two unusually large troops of kiang—one of some fifty, and the other of about thirty animals. The serried cavalcades would trot up towards us, and suddenly halt within 150 yards or so, and after standing there snorting and gazing wistfully at us for a few moments, wheel about, as if by word of command, and careering round in a wide circle, return again and again to perform the same manœuvre, ere galloping away for good and disappearing over some neighbouring rise.

Next day being Sunday, we were glad of a much-needed rest, not only for our weary limbs, but for relief to my face and hands, which were almost raw from the combined effects of biting wind and scorching sun. When that abominable blast happened not to be blowing, which was seldom, the climate at this place was simply perfect in the shade, although the cold at night was bitter as usual. Watching the proceedings of a colony of grey marmots (here called "pheeas"), not far from my tent, was quite an interesting pastime.

From Dongpu we had a long and weary tramp among the broken ground and deep ravines lying between it and the Sutlej. The one satisfaction I derived from going there was a good view of that river from the heights immediately above it—here a rapid flood of muddy snow-water, rolling along a desolate and verdureless valley between stony undulating hills. Almost directly below us I could see, spanning the stream, a wooden bridge, which only made me more fully realise the disappointing fact of my being debarred from so easily visiting the country beyond it, where bunchowr (wild yak) and other Tibetan game were said to abound. The wild camel, too, is found on some of the wide plateaux beyond the Kuen Lún range, farther north—though, even could one reach its haunts, it is not the kind of animal a sportsman would care to pull trigger on.

This was an utterly blank day. Not a living thing, either biped or quadruped, was to be seen. As we toiled

slowly and wearily over those boundless shingly slopes and high table-lands, breathless from their rarefied air, and buffeted by the ever-blowing blast, how often did I ask myself whether the game was really worth all the time and trouble entailed by its pursuit, until, late in the evening, we got back to camp, tired out and dejected. Even the stolid but usually good-tempered Puddoo showed evident symptoms of ill-humour at our fruitless work.

Some distance to the eastward of Dongpu lies a low range of rounded hills, known as the Lāl Dākā (red hills), so called from the brick-red colour pervading them. These hills are generally considered to be a favourite resort of *Oves Ammon*. The range is pretty extensive, but there is only one spot there nearer than the Shipchillum stream, at its eastern extremity, where water is to be found. Thither we now decided to proceed. Several hares, and some coveys of the Hodgsonian partridge, were put up on the way. As we neared our camping-place, on turning a corner in a winding ravine we came suddenly on four ewe *Oves*, one of which I shot to provide meat. The little stream that ran past the tents was full of diminutive dark-coloured fish, which were easily caught by dragging the water with a sheet, and proved excellent for eating. Hares were numerous in this vicinity, though, strange to say, very wild, but I did not care to disturb the ground by shooting at them.

The first morning we tried the western part of the range, but saw no fresh sign of large rams. Nothing could we find there except three ewes—probably the same lot I had shot one out of the day before: we therefore proceeded more eastward. About noon we made out four big-horned fellows about two miles off. Whilst working towards these we descried another flock of seven, and most of them good rams too, not far from the first lot. As usual, they were in an open and unapproachable position. Both lots, however, appeared to be feeding up towards the brow of a rise above

them ; so, after getting as near as we could, which was still over a mile from them, we lay down to watch their movements, in the hope that they would soon put the brow of the hill between them and us. As we lay motionless there, getting half roasted by the blazing sun, I was much entertained by a curious little entomological study that chanced to come under my observation. I noticed innumerable small grey grasshoppers — I should call them crickets, as there was very little grass for them to hop on — which showed a strange amount of curiosity respecting our persons. They came creeping towards us over the stones from all sides, even crawling and hopping over us, and paying particular attention to the oil on the guns, the flavour of which seemed to be very attractive to them. They were so fearless as even to greedily devour the ends of atoms of dry grass softened between my teeth and held close to their mouths.

As soon as the last of the rams had disappeared over the brow, we made for it as fast as we were able, in order to get there, if possible, before they were out of range beyond it ; but on reaching it, not a vestige of the animals was to be seen. Soon, however, we descried two fine rams in another direction, and whilst deliberating as to the best way of approaching them, six more came over a rise on to the same ground. It was truly a case of *embarras des richesses* this time, for the relative positions of the two lots were such that it was impossible to stalk one without our being detected by the other. As it was now growing late, and we were at least six miles from our camp, we reluctantly had to abandon further pursuit that evening, in the hope of finding the animals in the same vicinity next day.

As all the game appeared to be more eastward on the Lāl Dākā, the following morning our camp was shifted to a locality about seven miles off called Dukka, where there was grass for the jooboos, and a stream of water, among some low rounded hills near the foot of the Himalayan slopes. These

hills also were considered a favourite resort of *Ovis Ammon*, and our camp there would be within reach for a long beat over the eastern end of the Lāl Dākā range, which was separated from them by a level expanse some six miles wide. After packing off the jooboos, I started with Puddoo and a spare man to look after our friends of the previous evening. They were still near where we had last seen them, the two rams having apparently joined company with the flock of six. We contrived to get within 150 yards of them, but the shot was so downward that I had only the width of their backs to aim at. The first bullet went clean over a big fellow, upon which they all started off, but, after going a few yards, stood to look about them. Again my shot went high and missed, and this time they departed for good. We watched the retreating animals with silent disappointment until they were out of sight; but as such things will happen, there was no use grieving over my misfortune, so I sat down and consoled myself with my breakfast and a pipe, hoping for better luck next time. I had probably forgotten to allow for the flight of a bullet being less acted upon by the rarefied air at such an altitude, and so had used too high a sight.

After resting for a short while, we moved on eastward along the range, and had not gone far when Puddoo, who had been searching about with the telescope, discovered a magnificent old ram, lying alone, within half a mile of us; and, for a wonder, the ground was most favourable for circumventing him. When Puddoo got really excited over a stalk, he had a habit of slowly lifting the corners of his long woollen coat-tails and carefully tucking them one by one into his belt. By the time he had tucked all four corners up, we had got within 100 yards of the ram as he lay close to the edge of a small projecting slope below us, stretched out at full length on his side, with his back towards us, and his ponderous horns resting on the ground. For once I had caught an *Ovis Ammon* napping! A slight noise, unfortunately made in some manner, betrayed our

presence, and caused the animal to suddenly lift his head and look about him. Fearing lest he might spring to his feet and disappear over the edge of the slope before I should have time to get my aim on him, I foolishly, and against Puddoo's advice, fired without waiting, as I certainly ought to have done, until he rose. Starting to his feet, he stood for a second broadside on ; but as I was covering his shoulder for a second shot, he turned sharp round and dashed off downwards, just as I pressed the trigger, and was out of sight in an instant. *Eheu mihi!* I had missed him clean with both barrels! Words cannot express my feelings as I watched him going away after he reappeared. Puddoo, however, expressed his sentiments at the time pretty freely in his native dialect ; and could I have understood what he was saying, I might doubtless have heard some rather uncomplimentary remarks respecting my duffer-like performance. We followed the animal's tracks for a long way, on the slight chance of the first bullet having hit him with a ricochet, as we noticed it had knocked up the dust on our side of him, but not a drop of blood could we find ; so we sorrowfully turned our steps campwards. How I imprecated the cutting wind as we trudged wearily over the six long miles of flat ground between the Lāl Dākā and our camp. As we skirted along the base of the Dukka hills, we saw another big flock of *Oves Ammon* away up on the sloping heights to our left ; but we were both of us too done up and down-hearted to think of going after them that evening, even had there been time.

So hard was the frost here at night in the month of June, that the stream close to our camp, which we had forded nearly knee-deep the evening before, was until mid-day quite dry. Nothing was for the time left of it but a hollow crust of ice, below which the water had ceased to flow. Having to depend on this stream for water, we had, whilst here, to collect a sufficient supply overnight to last until it began to flow again next day at noon. It can

therefore be imagined what bitter cold work it was starting forth in the dawn to look after the animals we had seen on the neighbouring hills the evening before. About eight o'clock Puddoo spied out with the glass a flock of five *Oves*, but none of them were big rams. Whilst he was watching them through the telescope, I chanced to notice a large group of animals, which I took to be kiangs, suddenly appear away up on the sky-line of a rounded eminence nearly a mile off. Drawing Puddoo's attention to them, he turned the glass in their direction and instantly pronounced them to be "nian" (*Oves Ammon*). There were eleven in sight, and all of them were rams carrying fine horns. Presently they lay down on the very brow of the hill, where we could distinctly see their splendid heads in relief against the sky. As they completely overlooked our position, and were quite unapproachable from any other quarter, even could we have dared to move, there was nothing for it but to wait patiently there until they again rose and shifted their ground. The wind had now sprung up, which, combined with the keen frost, made the cold during the hour or more we had to lie there like stones, about as cruel as I have ever felt. My hands and feet got so benumbed that I began to think, if we remained there inactive much longer, they would be frozen. At last the animals rose, and after pottering restlessly about for some time, retired quickly beyond the brow towards the same direction they had come from.

On this occasion I fully appreciated the advantage of having a man with me who knew every feature of the ground as well as the habits of its wild denizens. Puddoo at once concludes that the animals will be likely to make for a wide ravine, where there is more or less grazing for them, some distance beyond and to the left of the brow they so hastily quitted, and that by our quickly making a circuit below, we may possibly be able to reach the foot of it in time to intercept them. Off we start as fast as we

can shuffle along, for running is next thing to impossible in such trying atmosphere. In less than an hour we have almost reached the foot of the ravine. As we cautiously approach it round the shoulder of a spur, I can judge by the unwonted haste with which Puddoo not only lifts his coat-tails, but this time winds them tightly round his waist, that his excitement is unusually intense. On gaining the cover of some rocks, which he says will command the lower part of the ravine where he hopes to find the flock, we slowly raise our heads to reconnoitre. We are just in the nick of time, as five or six of the animals, which are evidently still on the move, have reached the foot of the ravine, and one or two have commenced ascending an opposite slope at, as near as I can hastily judge, about 180 yards off. Quickly adjusting the sight, I let drive at a grand fellow as he stands for a second or two at the bottom of the slope; but from being rather shaky after our hurried stalk, I hit him in the haunch instead of the shoulder. Off they all speed, but again stop a short way up on the slope to look back, giving me ample time for a shot at another good beast, which rolls over to rise no more. Away they start again at a gallop, with the exception of a big old ram—not the wounded one—that lags slowly behind. I have now only my miniature .360-bore Rigby rifle left to use, and although many a black buck and cheetal stag, and once even a full-grown stag jurrow, have fallen to it, I hardly expect it to do for a big *Ovis Ammon* at quite 200 yards: but luck is on my side this time. The little expanding bullet chances to hit, and so hard that the old ram merely moves on a few faltering steps and once more stands stock-still. Meanwhile the rest of the flock have reached the top of the rise, and after standing clustered there for a few moments as if irresolute about their further movements, they finally disappear beyond it, with the first fellow I had shot at limping after them. Reloading the Whitworth as quickly as possible, I give the laggard I had wounded with

the little bullet another shot, which at first I am not sure has struck him, but after tottering for a few seconds he falls over on his side dead.

Had the Whitworth rifle been a breech-loader I should probably have accounted for at least one more of the animals, for, as they stood on the brow, they were not more than 250 yards off, and an *Ovis Ammon* is a good-sized mark to shoot at though he is sometimes so easily missed. Now the sporting reader will at once ask, "Why hadn't you a breech-loader?" Well, it was my misfortune, not my fault, that I had not, for a new Express rifle I had ordered especially for this trip was then lying useless at Dehra Doon, owing to the transmitting agents carelessly neglecting to forward it in time to take with me. However, I had little reason to repine in this instance, as two splendid old rams were down, and a third had gone off so badly wounded that I had great hopes of eventually securing him as well.

On moving across to the brow, which commanded an uninterrupted view of the wide flat between these hills and the Lāl Dākā, we could easily trace the course the animals were steering, and with the telescope I could distinguish the wounded one, now limping along ahead of the flock. At length we saw him lie down, whilst his companions slowly continued their course towards the Lāl Dākā. By this time it was getting late in the forenoon, so we had our breakfast, keeping an eye on the wounded ram whilst we were quickly disposing of it. The spare man was now despatched to camp to fetch jooboos for carrying the spoils, and also for my pipe, which I had purposely left behind under the impression that my egregious misses of the previous day might possibly have been due to my indulging too freely in tobacco. After watching the wounded ram for a long time, it being impossible to approach him where he lay, we at length saw him rise and hobble onward, stopping now and again, until he reached the Lāl Dākā,

where with the glass I could see he once more lay down on an open slope. It had now grown too late to follow him that afternoon, so we proceeded to gralloch the dead beasts. On the arrival of the jooboos, I sat down and thoroughly enjoyed a smoke whilst they were being packed with the spoils. On our return to camp, a dram of whisky was served out to all hands for celebrating this red-letter day among the big sheep. I weighed one of the rams with a portable machine I had brought with me — a Yankee "notion" which was "calculated" to weigh correctly up to 360 lb. The figures were as follows: Weight, "clean," 350 lb. odd, or about 18 stone. Of this, the head alone (as cut off for stuffing) was upwards of 50 lb., and perhaps 2 stone might be added for the gralloch, making a total of, say, 20 stone. Not a bad weight for a sheep! The horns were good average specimens of their kind. The larger pair would have measured quite $3\frac{1}{2}$ feet round the curve had not the tips been slightly broken. The other pair were a few inches shorter, but equally thick (18 inches), and their tips uninjured.

The following day we were not long in again finding the wounded ram, on a slope of the Lāl Dākā above the Shipchillum stream, and with the spy-glass I could distinctly see his blood-stained haunch. He was slowly moving upwards, but ere long he lay down on an exposed ridge high up on the range, from whence he evidently kept a sharp look-out on all sides, as we noticed that his head was being continually turned suspiciously about. It was necessary to use the utmost caution in approaching him, for any wounded wild animal is always hard to get near when not quite disabled, let alone an *Ovis Ammon*. After making a round of quite two miles, we had almost reached a spot which we had judged to be within 200 yards of him, when, suddenly taking alarm, he sprang to his feet. From the alacrity with which he at once sped upward and disappeared over the top of the range, it was evident that, although his

haunch was badly wounded, no bone was broken; and having detected us on his track, he would most likely go a very long distance without stopping, as a wounded beast on being alarmed often will do. At any rate, this was the last we ever saw of him, though possibly he fell to the rifle of another sportsman, who, when hunting on this ground shortly after us, killed a big ram there which had a recently made wound in its haunch.

On our way out in the early morning, several lots of small horned rams and ewes had been seen, and during our stalk after the wounded animal, we had noticed five rams move over the top of the range. We had also descried in the distance what we thought to be the eight remaining rams of the flock I had thinned the day before; but as they would now, most probably, be well on the alert, we turned our attention to the five fresh ones, three of which carried grand horns. We came upon them where they had stopped to graze in a ravine on the north side of the range, and we had just reached a spot from which, in another minute, I should have got an easy chance within 150 yards, when three other rams suddenly appeared, coming over the rise on the far side of the ravine, and instantly catching sight of us, turned tail and made off. Before I could get ready to shoot at the rams in the ravine, they also, taking alarm at the flight of the three intruders, started off at a gallop, and put a good 300 yards between us and them before they pulled up on the crest of a sloping spur, beyond another ravine running down on our right into the one they had just quitted. The first shot, sent at the big lord of the flock, knocked up the dust several yards short of him. From not having seen us, and being far out, the animals seemed only startled, so I had time for another chance. Again the bullet fell short, but this time so close to the big fellow's feet that it must have sent up the gravelly ground against him. The beasts now got so bewildered that, instead of at once disappearing behind the spur, as might ordinarily

have been expected, they galloped straight up along it, and again stood broadside on within 200 yards, and level with us across the ravine to our right, in the most tantalising manner. Oh for a good breech-loader then ! for I had only the "pea-shooter" left to depend on. Whether the big fellow carried away the contents of the latter I never found out, for though his tracks were followed far beyond the spur, nothing more of either him or his companions did we ever see again. There were eight or nine long miles to trudge over before getting back to camp, and I could have wished no fitter penalty for the delinquents who had so disappointed me about my Express rifle, than to have had them grinding breathlessly alongside me that afternoon, with the cold cutting wind blowing right in their teeth, and the glaring sun scorching the skin off their faces and cracked lips.

Next day was Sunday, and never did I more welcome a rest.

Tibetan wooden Cup and Tobacco-pipe.

CHAPTER XXIII.

THE time was now drawing nigh when, according to my contract with the Jongpen, I should have to quit Tibetan territory; and the Niti pass, over which I intended to return, was three or four days' journey from here. These few days I resolved to devote to hunting burrell, which Puddoo said were fairly plentiful in certain localities where there was some scanty vegetation,¹ below the snow-line, on the Himalayan northern slopes, along the foot of which our way led towards the pass. There would also be a chance left of finding *Oves Ammon* as well, though the ground was not considered so good for old rams as that which we had been over.

Our camp now presented the appearance of a "flesher's" shop, every available tent-rope being hung with long strips of raw meat drying in the sun. Cooking, too, was going on at a great rate, there being an unusual amount of fuel about here suitable for the purpose in the shape of a scrubby bush called *dāmā*. Indeed the table-lands lying between here and the *Lāl Dākā* were more scattered over with a scrubby sort of vegetation than any other locality I had visited in *Hundés*. Towards evening the sky, which had been cloudless since the slight snowstorm we had experienced at *Tāzāng*, became overcast, and a shower of rain fell, which raised the temperature in a most sudden and remarkable

¹ The limit of vegetation in these trans-Himalayan regions is at an altitude of about 17,000 feet.

manner—so much so that I could dispense with many of my warm wraps at night. Just after I had turned in to bed, a messenger arrived with a note—a surprising event in these inhospitable wilds. The epistle was from a son of the late Mr F. Wilson (of Himalayan hunting celebrity), intimating that he had just come over the Chor Hōti pass, and that his baggage-animals being unable to get as far as my camp that night, he (in a true sportsman-like spirit) had therefore sent on a messenger to ask me the direction of my beat next day, in order that he might not interfere by hunting over it. In reply, I told him I was leaving this ground next morning, but hoped to see him at breakfast before I started. Another note, however, arrived in his stead, telling me that as the Tibetans had allowed him only seven days in their territory, he was making the most of his short time in hunting, and so was unable to come. My time would in all probability have been equally limited had it not been for the revolver I had presented to the Jongpen of Dāpā, and the whisky with which I had propitiated his messengers.

As we intended hunting over the ground along our daily stages towards the pass, they were necessarily made rather short. The first day no game was seen, but a shot heard on the ground we had left told of Wilson having found something there. Our camp was reached just in time to escape a tremendous storm of hail, accompanied by much thunder and lightning. From here we despatched two men with some jooboos to Niti for a fresh stock of supplies, our present one being rather low. Late in the evening I received another note, this time from a sportsman camped in the neighbourhood, with whom, it turned out, I was acquainted. As I had not talked a word of my native language for more than six weeks, except to my dog Ranger, I was very glad that an opportunity was thus offered of meeting with a brother sportsman, and an acquaintance to boot. For the wanderer in these dreary

Tibetan solitudes is apt to get tired of his own society alone, and after a long spell of it, begins to fully realise the fact of his being naturally as gregarious in his habits as the wild animals he hunts there. Your native followers are capital fellows in their way; but, from the difference of their ideas and their mode of life, they cannot be your boon companions. You are in the same relative position to them as a burrell would be among a herd of tahr. No; nature never intended that white men and black should amalgamate a whit more than the burrell and the tahr, when she gave them each a skin of a different colour, whatever may be argued to the contrary. I therefore decided to remain here for a day, and asked my compatriot over to breakfast next morning. He had just come over the Niti pass, and had so far found no big rams; but as he was accompanied by an excellent Bhōtia shikaree, and was *en route* for the Lāl Dākā, his work was still before him. After hearing from him how the busy world had been wagging during the past two months, and giving him in return all the information I thought might be useful of this quiet and remote corner of it, not forgetting to describe the whereabouts of the big wounded ram, I wished him good luck as he continued his way towards the Dukka hills.

In the evening I took a murderous advantage of a large flock of blue Tibetan pigeons that came and settled to feed near the camp. A raking pot-shot on the ground, followed up with the second barrel as they rose, floored a baker's dozen of them, which, with eight I had secured the previous evening in the same ignoble manner, kept me in pigeon-pies for a week or more. The adage, "it never rains but it pours," was exemplified when again I was aroused from my slumbers by a messenger with yet another note. This one had been sent by an officer of the great Trigonometrical Survey of India, who with his party had arrived at our last camping-place, after crossing the Ūntadhura pass from the province of Kumaon. He was on his way, he told me, to fix his

survey stations on the highest points of the Lāl Dākā, with a view to making observations from them of more distant, and, to Europeans, almost unknown regions beyond the Sutlej. His letter contained a message respecting his progress thus far, which he asked me to convey to his chief—Colonel J. T. Walker, R.E., at Dehra Doon. I congratulated myself on having finished my hunting operations on the Lāl Dākā before he and his party commenced their scientific ones, which, valuable as they most assuredly would be to geographical interests, were not likely to be conducive to those of sport.

Next day we sent our camp on a few miles, whilst Puddoo and I took a beat over the broken slopes above, which turned out blank. In the evening, however, we did some successful fish-poaching—at which my Goorkha servant proved an adept—in a stream that ran past the camp, by constructing a dam to divert the course of the water above a shallow pool, the result being about a dozen fish left high and dry. They averaged five or six inches in length, and were coarse-headed and to all appearance scaleless, of a greyish colour above, silvery below, and profusely covered with dark-grey spots. Some of the streams in Tibet contain a prodigious number of fish, and all, I believe, are good eating. Many of the streams lose themselves in the sand, and appear again at intervals, sometimes only in little pools of clear water. These pools often teem with little fish about the size of small minnows. The glacier streams that flow from the north side of the Himalayan range, though perfectly clear until noon, are in the afternoon far more muddy and thick than those that flow from the south side. The fish in these northward-flowing streams ascend the clear little brooks that run into them, often in shoals, when quantities of them can sometimes easily be captured up to a pound or more in weight.

Here we found some Niti Bhōtias encamped, and amongst them one of Puddoo's brothers. From him we learnt that

the Niti pādān, who was travelling by another route, had brought up a lot of letters and newspapers for me; so I at once despatched a messenger to overhaul him, the arrival of a post-bag being as welcome and exciting an event as it was an unusual one in this remote region.

The ground now became more tiresome to traverse; the sides of the deep ravines we had to cross in our next day's work along the base of the Himalayan slopes being very abrupt, and the earth of which they were composed rotten and friable from constant frosts. The elevation, too, being considerably higher than that of the table-lands below, we consequently had "bellows to mend" pretty often, owing to the constant succession of ups and downs. Away up on the steep slopes above where we intended to camp, we made out with the telescope a flock of some twenty *Oves Ammon*, but all of them were ewes and lambs. Five or six burrell rams were also descried lower down, and to these we at once devoted our energies. We had managed to get round well above them, as we thought, when Puddoo, who was leading, suddenly caught sight of a single ram that was still slightly above us, at what looked to be well over 200 yards off. By great good luck he did not detect us from the commanding position he occupied, before we had made ourselves as flat as possible behind a hummock. As a burrell is not so big a mark as an *Ovis Ammon*, and there was such a gale of wind blowing as to make accurate shooting almost impossible, I refrained from attempting to take him at so great a disadvantage, hoping that we might eventually get nearer, until presently he lay down where he was. The sun had now sunk behind the snowy Himalayan summits, and still the burrell did not move. At long-last he rose, and as it had grown too late for us to wait until he thought proper to shift his ground, I decided to risk a long shot. He was standing broadside on, with the upper half of his body showing against the sky, and the strong wind was blowing from directly behind him; so taking as steady an aim as rude Boreas would permit, I

let drive at his haunch, trusting that the deflected bullet might catch him somewhere about the shoulder. "*Habet!*" Away he goes with that reckless headlong speed which an animal, when struck in the region of the heart, so often puts forth for a short distance ere he falls lifeless; and almost immediately we lose sight of him behind a neighbouring brow. As I had distinctly heard the unmistakable "tell" of the bullet, we at once followed up, and soon found him lying stone-dead, about 150 yards beyond where he had disappeared, with the bullet-hole just behind his shoulder. His head, which was a fairly good one, was cut off, and leaving his carcass to be fetched next morning, we were soon "making tracks" towards camp. On our way down we disturbed a large flock of burrell, our attention having first been drawn towards them by the clatter of stones and shingle dislodged, in their rapid flight, on the steep hill-face they were ascending. As far as we could see in the dusky light, they were ewes and little lambs. We were evidently in a nursery of both *Oves Ammon* and burrell in this locality, for we had seen no small lambs of either kind elsewhere.

Previous to our descent we had noticed that the companions of the ram I had killed, which turned out to be seven in number, had, after their first scare from the shot, resumed their composure and recommenced feeding considerably higher up among the slopes, owing probably to their not having actually seen us. We therefore decided to remain here a day, with a view to again attempting to circumvent them; besides, the dead beast had to be fetched down.

By reason of the manner in which nature so often assimilates the colour of wild animals to their surroundings, it is sometimes difficult to detect them at a distance with the naked eye, unless they are in motion; and the burrell exhibits a marked instance of this. With the aid of the telescope, however, we soon discovered the rams again next morning, though they had shifted their ground to where it

entailed a long circuit above to approach them. At length we arrived within 180 yards or so of their position, which was as near as we could possibly manage to get. It was not only a long shot, but also a nasty downward one, for which your sight elevation is always most difficult to judge correctly, even when you have not got rarefied air to take into account as well; consequently the first bullet went clean over the big ram I fired at. The report of the rifle, from being so far above them, I suppose, had luckily only the effect of startling the animals without putting them to flight. My first shot had given me a clue to the proper sighting, so the second was aimed about a yard short of the same fellow's stern as he stood end on with his head from me. Away they all scampered this time, but we could see that the one I had shot at, which had taken a separate line of his own, carried his off hind-leg dangling loosely about, though he still held on until we lost sight of him behind a ridge. We followed as quickly as possible to a commanding spot on the ridge, whence he was again viewed, now moving more slowly over a high tract of bare undulating ground, sloping gently up towards the snow-fields above, for which he was evidently steering. We watched him with the glass as he continued to hobble on, sometimes standing for a few moments to rest, until we began to despair of his ever lying down, as we hoped he would do. So I had my breakfast, and by the time it was finished the burrell must have been about two miles off. He now, however, began to show signs of a more permanent stoppage, for all above him was a steep bed of snow, which he evidently did not care to ascend with a broken leg, for he altered his course and moved slowly out of sight in a neighbouring ravine.

After watching for some time without seeing the beast emerge from the ravine, we concluded he must have at last lain down there, so we set off as fast as the lead-like weight of our "stumps" and the power of our "bellows" at such an altitude would admit of, until at length we neared the ravine.

Cautiously we stole towards it, as if treading on eggs; but on peering into it, not a sign of our burrell could we see. Thinking he must have gone down the ravine, we moved carefully onward with a view to searching for his tracks, and had not proceeded many yards when we heard a clatter behind us. To our surprise we saw that the beast had jumped up from where he had been lying hidden behind the cover of a rock just below where we had at first looked over into the shallow ravine. As he made off upward, along its wide and gently sloping bed, I lay down and got my elbows well planted for the steady pot-shot I each moment expected he would offer if he chanced to stop, as I did not care to risk missing him with a snap running one, which might have scared him away for good. At last he pulled up and turned broadside on to look back. I hesitate to mention the distance that I judged lay between us and him; suffice it to say, I thought it necessary to raise the sight that was marked 300 yards. Everything, however, was in my favour except the distance. The day was less windy than usual, the ground was fairly level, and my position was as steady as if I had been aiming at a target. Nevertheless I was as much astonished as delighted at seeing the ram fall flat on his side without even a struggle. On examining him we had some difficulty in finding the mark of the bullet that had floored him, until at last we discovered it in his neck, close behind the ears, which accounted for his having dropped so stone-dead. It was a lucky fluke. His horns were very prettily arched and 25 inches long. We were now a long way from camp, and as we proposed striking our tents early on the morrow, it was necessary to have the burrell fetched down that day; so we merely covered him up with stones as a protection from the wolves and birds, and after planting a stick with a handkerchief attached to attract attention towards the cairn, descended as quickly as possible. On our way down we de-

scribed in the distance a large flock of *Oves Ammon*, ewes and lambs, which we took to be the same we had seen on the previous evening.

Between this camp and the next, the slopes above the Tāzāng table-lands were worked over, but nothing better was seen than some ewe *Oves Ammon* and a flock of young males, which soon showed us the white of their sterns as they went scouring away in the distance.

A very troublesome mile or so had to be traversed before reaching our camp, through a deep abrupt-scarped ravine filled with huge detached blocks of rock and masses of hard old snow, over which we had to clamber. Our jooboos had been brought round by a lower and easier route. The Tartar escort here bade me farewell, and took their way homeward mounted on their bovine chargers, trusting to my good behaviour during the remainder of my short sojourn in their territory. They departed rejoicing greatly in a "bucksheesh" with which I presented them; and being Lamas, let us hope they gave their little prayer-wheels an extra twirl on my behalf, as a parting benediction.

The following morning broke with rain, which was still drizzling when we packed up and started about noon. It had been our intention to cross the pass that day, but it was now too late to attempt to get farther than its foot. In a bed of black-looking soil we passed on our way I found numerous fossils—ammonites and belemnites—which my Bhōtia companions called "shalgram" stones. About a mile short of the spot where we proposed passing the night we took shelter from the rain, until the jooboos came up, in a blanket-tent—the *douane* of the pass. Two of its five or six occupants were squatted on the ground throwing dice, whilst the rest were lolling lazily about, either dozing or smoking their little brass-bowled pipes. The manners of these Tartar excisemen were bluff and independent, but quite civil. On our entering the tent, a small wooden cup

was ladled full of tea from a dirty metal pot on the fire, and offered to each of us in turn. The tea¹ was made, as is the custom in Tibet, with butter and salt. It was greasy uninviting stuff, but I swallowed a cup of it in good-fellowship. This rite of Tibetan hospitality being over, the play was resumed. The ostensible stakes were pebbles, though they doubtless represented something more valuable. The dice were cast from the little wooden cups of the players, each time with a short exclamation like "put." Although I watched the game intently for some time, I failed to follow the intricate score. On rising to leave the tent I was presented with a token of goodwill from the Jongpen, in the shape of some more yaks' tails, and two round lumps of butter sewn up in raw sheep's-hide as tight and hard as a cricket-ball. Puddoo told me that yak-milk butter thus prepared keeps good for a very long time in the dry cold climate of Tibet, and that these balls were probably more than a year old. Whatever was their age, the butter they contained was tolerably palatable.

The rain had now become sleet, and the icy wind blowing down off the snow-fields had increased to a gale, which made pitching the tents, with our hands benumbed with cold, a rather trying job. As the scant amount of grass-root fuel we could collect was wet, and refused to emit anything but smoke, I served out grog all round to my shivering companions, and after a hastily despatched meal, turned in under my blankets to try and keep warm. In the morning there were two inches of snow on the tents, it was still snowing, and the pass was enveloped in mist. About eleven o'clock the sun shone forth again, so we commenced the ascent. The jooboos had a rough time of it ploughing up through the fresh fallen snow, which was also most trying to our eyes. On the summit of the pass we met

¹ The Tibetans import their tea from China in the form of solid lumps known as "brick-tea."

the men and jooboos returning from Niti with the supplies. A leathern flask of native spirits they had brought with them was produced and freely imbibed from by my Bhōtia followers, who had not had a big drink for a month. The liquor was weak mawkish-tasted stuff like bad whisky. It was potent enough, however, to make Puddoo very drunk, so I left him to the tender mercies of his companions. When he turned up towards evening at the tents, he had got sufficiently sober to look sheepish and ashamed of himself. And here I may offer a bit of advice: never touch spirits on a cold high pass, where their effects are as rapid as they are disagreeable, and your head often aches badly enough there without them.

The road between the pass and Niti had been repaired by the Bhōtias. Even in the narrow defile above Goting, where the snow-bed had now disappeared and the track lay over the steep stony scarps rising from the river, the jooboos had not much difficulty in getting along, although in some places, on landslips, it was like walking over loose broken bricks. And below Goting, where the steep snow-slopes had been so troublesome, you might almost have cantered a pony. About Niti, too, what a change had come over the scene! The village was busy with life, and the neighbouring heights, which only about a month before had been cold, bare, and desolate, were now cheerful with the yodling of herdsmen tending their flocks on the green slopes, and tuneful with the cuckoo's notes in the leafy birch-brakes.

As Puddoo and Co. had been celebrating their return home by a drunken debauch overnight, I had considerable difficulty in getting the jooboos collected and loaded to start at a late hour next morning. At Malāri women took the place of the jooboos as baggage-carriers, the village being almost destitute of men, most of whom had gone off with their droves of laden sheep and goats to Hundés to

trade with the Hoonyas. Here I bade farewell to my worthy friend Puddoo and his Bhōtia companions, who were all about to set out again for Hundés on business of their own.

At Tapoobun I left the low hot route by which I had travelled up, and returned over the middle ranges by a higher and more beautiful one. An ascent of about 5000 feet from the river, partly through a forest of large hazel *trees* — not bushes — brought us to a small green flat near the ridge of a spur of Trisool, where wild-flowers and wild strawberries vied with each other in their abundance.

During the day the clouds had been dull and lowering, veiling the mountain-tops deeply in mist, but towards evening they began to lift and disperse, and never in my wanderings over many parts of the globe have I seen anything to equal the marvellously grand and expansive panorama which the rising curtain of sun-illuminated, rose-tinted vapour gradually disclosed to view. It was indeed a splendid final transformation-scene, so to speak, in this vast theatre of nature I was leaving, and will ever remain deeply engraved on my memory. Eastward, to the right, over a rugged foreground of huge fragments of grey rock, and the irregular line of pointed plumes of the dark-green pines shooting up, tall and straight, from the mountain-side below, rose the noble snow-cone of Doonagiri in bold relief against an intensely blue firmament; whilst the more distant crest of Kāmet (25,400 feet) reared itself among a medley of frozen peaks, glaciers, and vast untrodden snow-fields lying in dreamy magnificence away northward. Nearer, and more westward, across the profound hazy depth of the intervening valley of the Doulee, mighty phalanxes of rock-panoplied giants, mantled in violet, purple, and blue, and helmeted with eternal snow, stood resplendent in the golden glory of sunset, keeping watch, as it were, around

the sacred precincts of the Badrinath shrine lying latent in one of the deep dark gorges below them.

Temple of Badrinath.

Not a sound disturbed Nature's calm repose save the wild call of the moonal pheasant echoing among the neighbouring crags, as I sat there enraptured with the glorious scene before me, watching the cold grey shade creeping slowly on, and gradually darkening each successive sunlit mountain tier, until it stole over the highest peaks of eternal snow, leaving them weird-looking and unearthly in their stern frozen dignity, their pallid lineaments each moment growing more dim in the deepening gloom.

In two days from here I reached Ramnee—a charming locality as regards scenery and climate, and a capital centre

for sport, there being excellent ground for jurrow, gooral, and other middle-range game, in its almost immediate vicinity, and both burrell and tahr were plentiful on the higher ranges within a few days' reach of it. But the rainy season had now set in, and the horns of the jurrow stags were still in velvet; so I proceeded on my way, and in about ten more days had rejoined my regiment.

This was my last expedition to the higher regions of those grand old mountains, whose memories are so dear to me, and which, alas, I shall never see again!

Tartar tent.

CHAPTER XXIV.

BEFORE taking leave of the kind reader, I would crave his patience for a moment or two longer whilst I add a few concluding remarks, some of which may be of use to the inexperienced, whereas others I should perhaps call apologies for my shortcomings.

To those who are not disciples of St Hubert, should they have cared to open such a volume, the fact of its being almost entirely devoted to subjects connected with wild sport will, I fear, have made it dull and unavoidably egotistical; and the brief descriptions of animals will, I dare say, have been as uninteresting as they are imperfect. These latter are mere notes of my own observations. They are given more for the benefit of those who, being unacquainted with the Himalayan *feræ naturæ*, may naturally, when reading of their pursuit, wish to know something about their general appearance¹ and habits, than with the idea of adding anything to natural history beyond that which is well known.

The tyro, I venture to hope, may not have found this book altogether uninteresting, and some of the hints it contains may possibly be of some service to him.

To any old Himalayan sportsman who may have perused it, most of its contents will doubtless have proved stale. Still, I trust that it will have served to while away a few

¹ The two groups of heads, from photographs by Mr R. Milne of Aboyne, have been given with the same intention.

leisure hours by recalling to his mind some of the scenes and incidents of his own experiences.

To such as consider competition in scoring a big bag more than the beauties of nature, combined with real wild sport, my sentiments have perhaps been rather freely expressed. But in giving vent to them I feel sure I only echo the voice of the majority; for it behoves every one who has the interests of sport truly at heart, to strive as far as possible to discourage cruel, useless, and indiscriminate destruction of game at all seasons in a country where there are no strictly enforced laws for its protection.

One object at any rate will have been attained, if the unvarnished sketches of wild Himalayan life and sport I have endeavoured to portray may, in conjunction with other works on the same subject, offer an incitement for young hands going to India to spend some of their spare time there profitably for both mind and body, in visiting these grand and inexhaustible hunting-grounds. But those who hope to be successful in Himalayan sport must be prepared to undergo a good deal of trouble, toil, and frequent disappointment, and to have a fair stock of those cardinal virtues in all manly sports—namely, patience, endurance, and perseverance. For no one ought to start with the idea that game will always be found wherever it is sought after, be the ground ever so good.

By the inexperienced in rough mountain work, it may perhaps be expected that I should offer a few suggestions respecting the kit which ought to be taken on a hunting-trip to the Himalayas. Well, to those I say, take nothing from your own country beyond the requirements of an ordinary traveller, except your battery,—a double 500-bore Express rifle, and a 12-bore gun for ball or shot, will, I think, be ample; its ammunition; a good telescope with large field; and, if you be disciples of the immortal Izaak, your fishing-tackle. To these may be added a couple of pairs of strong shooting-boots well shod with square-headed nails, and a few

pairs of very thick double-heeled and double-toed worsted stockings. Tents and all other requisites, even to a Warren's cooking-pot, can easily be procured in India, and most of them will be more suitable for the purpose they are intended than the things you may spare yourselves the trouble of carrying so far with you.

The tent I have always used, and which, I think, will be found comfortable and portable, as well as suitable for pitching on a limited space, is of the following description. Material, the common cotton cloth of India called "dosootee"—as being light and easily dried—lined with coarse white (as being more cheerful than the ordinary black) native blanket. Width of tent, $9\frac{1}{2}$ feet; length from pole to pole, $7\frac{1}{2}$ feet; height $6\frac{1}{2}$ feet, with small hanging walls at the sides 9 inches deep. Four short ropes of thin but strong cord, for making fast to pegs on each side; and a stay-rope for each upright pole, of the same material. The ridge and upright poles to be of thin strong male bamboo. Front end of tent to open from top to bottom, but made so as to overlap well when closed either with strings or leather buttons. Back end to open in like manner, but made to lace up, with a flap to button over the lacing in order to keep out the wind. By this means the tent can be thrown wide open at both ends for a free current of air during hot weather. In order to resist the wear and tear of stones, which in Tibet are often piled round the bottom of the tent, it should be edged all round with coarse thick tape called "newar," four inches wide. Such a kind of little tent, or "shuldarree" as in India it is called, can be carried by one man, and the poles used as walking-staves by the coolies. A second tent of a similar description will be required for your servants. In the Himalayas, tent-pegs can generally be cut near at hand; but for Tibet, where wood is not procurable, about two dozen light iron ones will be necessary, and made so that when not in use they can be chained together and secured with a padlock,

otherwise they are apt to stick to "light-fingered" hands like needles to a magnet.

The best kind of camp-bed is that made like the native's common "charpai" (bedstead, literally meaning four legs), constructed so that the side and end poles can be removed from the holes made for them in the legs. A piece of strong "durrie" (coarse Indian canvas) is laced tightly to one of the end and one of the side poles, the other two having first been passed through loops made to receive them by doubling over the canvas, thereby saving time and trouble in lacing. The great advantage of such a bed is its simplicity, as, if a pole is broken, it can easily be replaced with a stick from the nearest wood; besides its convenience of transport.

For whatever else in the way of travelling equipments the sportsman may deem necessary, I may refer him to 'Galton's Art of Travel' and 'Hints to Travellers,' published by the Royal Geographical Society. But the less he takes with him, beyond what is absolutely required, the better, more especially on the higher ranges, where carriage for his traps and his trophies is often difficult to obtain.

The following will be found a good way of dealing with large-horned heads, as rendering them more portable. When skinning a head, which should be cut off as near the trunk as possible without disfiguring the rest of the skin, commence by slitting up the skin on the *top* of the neck towards the nape, almost as far as the space between the burrs. From thence cut a short lateral slit to the base of each horn. Then peel off the skin bodily from the neck and head, severing the cartilages of the ears from the head as they are reached. After the skull has been thoroughly cleaned, and the lower jaw removed from it, saw it in two down the centre. When required to be set up, the divided skull is refastened together and the lower jaw replaced. The skin of the head should be well rubbed, more especially about the roots of the ears and the lips, with salt and wood-

ashes, or arsenical soap, then partially dried in the sun and packed separately. Thus there is no chance of the hair being rubbed off in transport. Moreover, the unsightly mark of a join on the gullet is obviated when the head is eventually stuffed. I may further suggest that when your shikarees, should they be Mahomedans, perform the "hullal," they should be strictly warned not to bleed the animal close behind the jaws, as is invariably their custom, thereby disfiguring the throat; but to do so far back, where the head is to be severed from the trunk, as a bit of the neck adds so much to the appearance of a specimen when set up.

It has been suggested to me that a sketch-map should be attached to this book. But with such excellent topographical and route maps as are published at the office of the Surveyor-General of India, at Calcutta, to refer to, anything less perfect would be worse than superfluous. And with the landmarks, together with the habitats of different game given throughout these pages, the sportsman can have little difficulty in finding his way to many of the best hunting-grounds.

The means of communication with India are now so rapid and easy, that a trip to the Himalayas is nothing to any one accustomed to travel. The very name of India, which carries with it, and truly to a certain extent, the idea of heat, sickness, and discomfort, deters many from going there, except, perhaps, for a few winter months, when some of its grandest attractions are lost to the sportsman or tourist, owing to the higher Himalayan ranges being then almost impracticable from snow. But it must be borne in mind that a "gentleman at large" in India differs vastly, in his position there, from a servant of Government. The latter has, of course, to put up with whatever inconveniences may fall to his lot, and is dependent for his shikar expeditions on the limited periods of leave he may be able to obtain, and these at times of year which are not always the best either for travel or sport; whereas the former, who is

tied neither to time nor to place, can suit his taste as to season and climate, and indulge his sporting or wandering proclivities to his heart's content, amidst romantic scenery which rivals, if it does not surpass, that of any other part of the known world.

Horns of Goen (swamp-deer), killed in the Oude Terai.

INDEX.

- Allah and the Prophet, assistance of, implored, 185.
Aneroid at fault, 311.
Antelope, four-horned, 144—Tibetan, 235—herd of, 236—shooting a buck, 237.
Apparition, an unexpected, 195.
Apricots, dried, 252.
Argus, the horned, 187.
Artifices for following the trail of stags, 212.
Ascent, long and arduous, 67—of Himalayan snow-peaks, 305—obstacles thereto, 305.
Avalanches, 92, 106, 311—of rocks and stones, 97, 295.
Badrinath shrine, the, 349.
Baggage-yaks, 248.
"Baloo Mar," the village Nimrod, 33.
Baramoola village, 93.
Basevi, Captain, 229—parting with, before his death, 253.
Bear-hunt, a, 11—trying to knock up a, 181.
Bear-meat, 17.
Bears, black, 9, 11—a mother deserts her cub, 15—fate of a cunning animal, 16—where to hit them, 19—shooting, in the mulberry-groves, 123.
Bears, brown Himalayan, 98, 101—stalking two, 114.
Beast, mysterious, a, 297.
Beehives, village, 17.
Bees, wild, 157—result of disturbing them, *ib.*
Beeves, wild, 243.
Benighted on the hill, 116.
Bezoar, 192.
Bhōtias, the, 289, 308.
Bingareebeyl, cascade of, 292.
Birch-bark, uses of, 182.
Blackbirds, singing of, 188.
Bone, a mended, 169.
Boortze, a Tibetan plant, 250.
Bridge, an awkward, 313.
Bronchitis attacks *Ovis Ammon*, 324.
Buck, a patriarchal old, 104—solitary old, 294.
Buck-fever, 37.
Buddhist cairns, 230—monastery of Hemis, *ib.*
Bumpa hamlet, 309.
Burning of grass, annual, on the mountains, 83.
Burrell-ground, 303—flock of, 312—watching for, 314—wounded, watching a, 343.
Camp-bed, best kind of, 354.
Cane-brakes, 148.
Carrion-eating tiger, 56.
Cashmere method of driving a gorge, 226.
Cashmere shikarees, 95.
Cashmere, Vale of, 92.
Cat, wild, enormous, killed, 63.
Cedars, deodar, 4.

- Chances of stalking ibex ruined by an impostor, 118.
 Changchenmo, 229, 231.
 Changchenmo river, 234, 235 — re-fording the, 249.
 Chang la, 230, 239.
 Chang Loong Koongma, 235.
 Chang Loong Yokma, 235.
 Changter engaged as guide, 231.
 Chenab, the river, 106.
 Chimray, 230.
 Chinese frontier, 257.
 Chinese outpost, a 268—interview with the borderers, 269—their behaviour, *ib.*
 Chipla, the, and its characteristics, 79.
 Chipla mountain, visit the, 62.
 Chooshul, 257.
 Chor Hōti pass, 309.
 Chuckmuck, 89.
 Chumurti, a Chinese-Tibetan territory, 267.
 Chung, the spirit of the country, 233.
 Climate, delightful, 33.
 Clouds, up among the, 301.
 Cold at night, 218—intense, 277.
 Communication, means of, with India, 355.
 Competition-bag of game, 228.
 Conference as to shooting-ground, 234.
 Conflagration, grand, 224.
 Cooking under difficulties, 296.
 Crocodile, adventure with a, 137.
 Cypress-trees, 307.
 Dangerous slopes, 86.
 Dapa, the residency of the Jongpen, 318, 322.
 Day after small game, 130.
 "Debsing" grass, 321.
 Deer, barking, the little, 25—tracking in a snowstorm, 216—wounded, a, 46.
 Dehra Doon, 5, 333—departure from, 288—valley of, 128.
 Denizens, meeting the wild, 6—wild, of the Surjoo valley, 23.
 Dentist, native, a, at work, 213.
 Dhuj, departure for, 42.
 Dhurrumsala military station, 287.
 Dislocation of arm, 178.
 Distance, misjudging, 342.
 Dog, wild, 45.
 Dogs, sporting Tibetan, 258.
 Dong, a, in view, 245—searching for, 241—stalking a, 246.
 Dongpu, a Tartar hamlet, 325—from, to the Sutlej, 326.
 "Dook," 119.
 Doonagiri peak, 298.
 Doonagiri village, 303.
 Doulee river, the, 289—crossing the, 304.
 Doulee valley, beauty of the, 307.
 Dukka hills, the, 328, 339.
 Dung, yak's, used for fuel, 231.
 Elephant, manœuvres of an, 136—vicious, 149—ride after wild, 152—taming recently captured animals, 156—result of elephant chase, *ib.*
 Express rifle, 336.
 Fair, holy, and the cholera pest, 7.
 Farewell to the mountains, 350.
 Feline demon, a hunt after a, 59.
 Fish, heavy, lost, 28.
 Fishing, exciting, for mahseer, 29—in the Jhelum, 125—prohibited in certain places, *ib.*—the reason why, 126—theories, 32.
 Flag-grass, 137.
 Flesh, unusual supply of, 337.
 Floating gardens, 126.
 Flowers wild, Tibetan, 272.
 Fog, cold damp, 27.
 Folk-lore concerning the Gopee Chund district, 163.
 Football, terrible game of, 151.
 Forest monarch, the, 219—fires, 225.
 Fox, Tibetan, 243.
 Frost-bite, 280.
 Frozen, almost, 331.
 Fuel, limited supply of, 280.
 Furriabadee river, the, 113.
 Gallantry of the stags, 201.
 Game-driving in Cashmere, 226.

- Game, great variety of, in Dehra Doon, 128.
- Gazelle, Indian, 3—Tibetan, 264.
- Geese, wild, 274.
- Glacier, a Himalayan, 303.
- Glaciers, confluence of, 267—immense, 286.
- Glen, evil genius of the, 300.
- Glissading down a steep place, 195.
- Goa or Tibetan gazelle, 264—description of the, *ib.*—shooting a, 265.
- Goojur's, a, black stag, 221—he is shot, 223—a grand set of horns, 224.
- Goral or Himalayan chamois, 24, 35—stalking, 47—shooting, 165.
- Gopee Chund hill, the, 163.
- Goree, river, 67.
- Goting, 310, 311—roads near, 347.
- Grasshoppers, a study of, 328.
- Grass-root fuel, 346.
- Grog, hot, 182.
- Ground, bad, 72.
- Gumsali hamlet, 309.
- Gurhwal mountain pass, 288.
- Hair-cutting with a knife, 252.
- Hampta pass, the, 286.
- Hangul, or Cashmere stag, 199, 202—shooting, 227.
- Hanlé, district of, 264.
- Hanlé river, 267.
- Happy hunting-grounds, 127.
- Hares, shooting fine, 252.
- Hart, royal, a shot at a, 206—a shot in the dusk, 207.
- Haunted house, a, 10.
- Heads, skinning, 354.
- Himalayan scenery and sport, 2.
- Himalayas, upper ranges of the, 240.
- Hindu-Koh, meaning of, 1.
- Hints concerning kit, camp-equipage, &c., for a Himalayan hunting-trip, 351.
- Hog-deer (*Axis porcinus*), 144.
- Hoonya cavalry, 319.
- Hoonyas and their flocks, 323.
- Hoonyas, the, 310.
- Horses, wild, grazing, 243.
- Hospitality, native, 179.
- Hot spring, 113.
- Hummām in Srinuggur, 124.
- Hundés, 310—undulating uplands of, 320.
- Hurdwar, 7.
- Hunting etiquette, 2.
- Ibex, the Himalayan, 108—pursuit of, 111—frugal repast of, 112—a herd of, 113—a herd of splendid, 119—shooting a splendid buck, 120—more big bucks, 122—another buck got, *ib.*
- Ibex-hunting, best season for, 92.
- Indian mountains, ascent of, 305.
- Indus, route along the upper waters of the, 230—ferrying the, 264.
- Intruders on the scene, 335.
- Inveigling wily mahseer, 28.
- Iron-shod pole, 86.
- Islamabad, 96.
- Jeetoo, old, a shikaree, 49.
- Jerking meat, 188.
- Jhelum, the river, 93—windings of the, 96.
- Joke, fatal practical, 16.
- Jongpen, a deputation from, 318.
- “Jula,” crossing a, 4.
- Jurrow, the, of the Himalayas, 25—near quarters with a, 43—hunting for, 45—modes of killing, 48.
- Kailás peak, 317.
- Kallee or Sarda river, 77.
- Kāmet, crest of, 348.
- Kangra, valley of the, 287.
- Karzok, 274—return to, 277.
- Karzok men, 275.
- Kazima, bidding adieu to, 197—meet him several years afterwards, 198.
- Kazura la, 275.
- Khedda camp, the, 153.
- “Khud,” driving a, 169.
- Kiang, wild horse of Tibet, 235, 321.
- Kookerie, or Goorkha knife, 26.
- Kosa village, 307.
- “Krās,” shooting a, 216.
- Kuen Lùn range, 326.
- Kugrang, a long glen, 234—going up the, 235.

- Kulu, pine-clad hills of, 286.
 Kumaon, the hills of, 7.
 Kumaon mountain-passes, 288.
 Kurreem, a half-bred Tartar, 229.
- Ladak, a start for, 228.
 Lāl Dākā, a range of hills, 320, 327, 333, 337.
 Lanak la, 272.
 Landslip, recent, 164.
 Leh, arrival at, 228, 240.
 Leopards, 9—watching for, 50—man-eating, 58—a snow, shares the spoils, 316.
 Light and shade effects on the mountains, 74.
 Lingzitang, desert plain of, 236.
 Lookoong, 233—leave, 257.
 "Loongees," horned argus-pheasant, 69.
 Lost trophies always the finest, 220.
- Mahseer-fishing, 3—description of the fish, 21.
 Malāri, village of, 307, 308.
 Mansorawar, lake of, 317.
 Markhor, (*Capra megaceros*) 174—description of, *ib.*—difficulty of finding great old, 181—a herd of, 182.
 Marmot, the Himalayan, 99—Tibetan, 262.
 Mārroo Wurdwan, 100.
 Marsemik, 239—camping on, 249.
 Marsemik la, crossing over the, 233.
 Martund, the Temple of the Sun, 208.
 Meeting, an unexpected, 338.
 Menu, a rare, 253.
 Mergun pass, recrossing the, 123.
 Mirpa tso, a lake surrounded by hills, 258.
 Mirza, establishment of, surgeon and barber, 124.
 Morass, quaking, 149.
 Morning, a cheerless, 250.
 Mountain belles, 90.
 Mountains, starting for the, 3.
 Mulberry-trees, 98.
 Musk-deer and its scent-bag, 75.
 Mussoorie, descending from, 5.
 Muzzle-loader, an old, 1.
- Nandadevi, snow-fields of, 291.
 Nāpoo, or burrell, the blue wild sheep of the Himalayas, 258—description of the, 284—two killed, 286.
 Nari-Khorsum, 288.
 Natives treed by a tigress, 147.
 Nature's awful works, 282.
 Nawab (native gentleman), paying respects to a, 173.
 Nian, *Ovis Ammon*, hunting the, 255—description of, *ib.*
 Night, a wild, 102.
 Night vigil, a, 220.
 Nightjars, 166.
 Niti, despatch of messengers to, 338.
 Niti ghat, 288.
 Niti padan, 341.
 Niti pass, the, 278, 309, 317.
 Niti village, 309.
 Nouboog, hamlet of, 97.
 Nouboog Nye forests, the, 201—headquarters at the hamlet, 203—bivouac in the forest, 204.
 "Null" jungle, 147.
 Numa, return to, 263.
 Nynee Tāl, 8.
- Oak-trees, shooting bears in, 13.
 Onions, raw, 234.
 Ooti, 273.
 Otters, young, 133.
Oves Ammon, 337—getting a long and lucky shot at, 261—flock of, 322—catching an, asleep, 329.
- Pangong district, 231.
 Pangong lake, 277.
 Pangong tso, 232, 257.
 Pangoor tso, a small salt lake, 258.
 Parang, a flood of melted snow, 279.
 Parang la, the, 279—across it in a snowstorm, 280.
 Parang, valley of the, 279.
 Partridge, black, 132.
 Peacocks, presence of, 132.
 Peepsas flies, 64.
 Pewra or olive partridge, 42.
 Pheasants, Kallege, 39—"Koklass," 42, 187—snow, 312—brood of, 277—moonal, 70.
 Pigeons, blue, 339.

- Pigs, wild, 40.
 Pir Punchal range, 172.
 Pithoragarh or Shore, 9.
